

CITY OF HOBART

# **AGENDA**

## **City Planning Committee Meeting**

### **Open Portion**

**Monday, 14 January 2019**

**at 5:00 pm**

**Lady Osborne Room, Town Hall**

## THE MISSION

**Our mission is to ensure good governance of our capital City.**

## THE VALUES

**The Council is:**

|                            |  |
|----------------------------|--|
| <b>about people</b>        | We value people – our community, our customers and colleagues. |
| <b>professional</b>        | We take pride in our work.                                     |
| <b>enterprising</b>        | We look for ways to create value.                              |
| <b>responsive</b>          | We're accessible and focused on service.                       |
| <b>inclusive</b>           | We respect diversity in people and ideas.                      |
| <b>making a difference</b> | We recognise that everything we do shapes Hobart's future.     |

---

## **ORDER OF BUSINESS**

---

**Business listed on the agenda is to be conducted in the order in which it is set out, unless the committee by simple majority determines otherwise.**

### **APOLOGIES AND LEAVE OF ABSENCE**

**City Planning Committee Meeting (Open Portion) held Monday, 14 January 2019 at 5:00 pm in the Lady Osborne Room, Town Hall.**

**COMMITTEE MEMBERS**

Deputy Lord Mayor Burnet (Chairman)  
Briscoe  
Denison  
Harvey  
Behrakis

**Apologies:**

**Leave of Absence:** Nil.

**NON-MEMBERS**

Lord Mayor Reynolds  
Zucco  
Sexton  
Thomas  
Dutta  
Ewin  
Sherlock

**1. CO-OPTION OF A COMMITTEE MEMBER IN THE EVENT OF A VACANCY**

---

**2. CONFIRMATION OF MINUTES**

---

The minutes of the Open Portion of the City Planning Committee meeting held on [Monday, 10 December 2018](#) and the Special City Planning Committee meeting held on [Monday, 17 December 2018](#), are submitted for confirming as an accurate record.

**3. CONSIDERATION OF SUPPLEMENTARY ITEMS**

---

Ref: Part 2, Regulation 8(6) of the *Local Government (Meeting Procedures) Regulations 2015*.

**Recommendation**

That the Committee resolve to deal with any supplementary items not appearing on the agenda, as reported by the General Manager.

#### **4. INDICATIONS OF PECUNIARY AND CONFLICTS OF INTEREST**

---

Ref: Part 2, Regulation 8(7) of the *Local Government (Meeting Procedures) Regulations 2015*.

Members of the Committee are requested to indicate where they may have any pecuniary or conflict of interest in respect to any matter appearing on the agenda, or any supplementary item to the agenda, which the Committee has resolved to deal with.

#### **5. TRANSFER OF AGENDA ITEMS**

---

Regulation 15 of the *Local Government (Meeting Procedures) Regulations 2015*.

A Committee may close a part of a meeting to the public where a matter to be discussed falls within 15(2) of the above regulations.

In the event that the committee transfer an item to the closed portion, the reasons for doing so should be stated.

Are there any items which should be transferred from this agenda to the closed portion of the agenda, or from the closed to the open portion of the agenda?

#### **6. PLANNING AUTHORITY ITEMS - CONSIDERATION OF ITEMS WITH DEPUTATIONS**

---

In accordance with the requirements of Part 2 Regulation 8(3) of the *Local Government (Meeting Procedures) Regulations 2015*, the General Manager is to arrange the agenda so that the planning authority items are sequential.

In accordance with Part 2 Regulation 8(4) of the *Local Government (Meeting Procedures) Regulations 2015*, the Committee by simple majority may change the order of any of the items listed on the agenda, but in the case of planning items they must still be considered sequentially – in other words they still have to be dealt with as a single group on the agenda.

Where deputations are to be received in respect to planning items, past practice has been to move consideration of these items to the beginning of the meeting.

#### **RECOMMENDATION**

That in accordance with Regulation 8(4) of the *Local Government (Meeting Procedures) Regulations 2015*, the Committee resolve to deal with any items which have deputations by members of the public regarding any planning matter listed on the agenda, to be taken out of sequence in order to deal with deputations at the beginning of the meeting.

## **7. COMMITTEE ACTING AS PLANNING AUTHORITY**

---

In accordance with the provisions of Part 2 Regulation 25 of the *Local Government (Meeting Procedures) Regulations 2015*, the intention of the Committee to act as a planning authority pursuant to the *Land Use Planning and Approvals Act 1993* is to be noted.

In accordance with Regulation 25, the Committee will act as a planning authority in respect to those matters appearing under this heading on the agenda, inclusive of any supplementary items.

The Committee is reminded that in order to comply with Regulation 25(2), the General Manager is to ensure that the reasons for a decision by a Council or Council Committee acting as a planning authority are recorded in the minutes.

**7.1 APPLICATIONS UNDER THE SULLIVANS COVE PLANNING SCHEME 1997**

---

**7.1.1 34 DAVEY STREET, HOBART - PARTIAL DEMOLITION, ALTERATIONS AND EXTENSION TO PREVIOUSLY APPROVED DEVELOPMENT  
PLN-18-798 - FILE REF: F18/154094**

---

Address: 34 Davey Street, Hobart

Proposal: Partial Demolition, Alterations and Extension to Previously Approved Development

Expiry Date: 22 January 2019

Extension of Time: Not applicable

Author: Ben Ikin

**RECOMMENDATION**

That pursuant to the *Sullivans Cove Planning Scheme 1997*, the Council refuse the application for partial demolition, alterations and extension to previously approved development at 34 Davey Street, Hobart for the following reason:

1. The proposal does not meet the 'permitted' building or works' provision or the 'discretionary building or works provision at clauses 22.4.4 and 22.4.5 of the *Sullivans Cove Planning Scheme 1997* in relation to the listed place at 12 Murray Street because: (a) It does not complement and contribute to the cultural significance, character and appearance of the place; (b) It does not comply with the conservation strategy of the submitted Conservation Plan; and (c) The location, bulk and appearance of the proposed work will adversely affect the heritage values of the existing façade.

| Proposal:             | Partial Demolition, Alterations and Extension to Previously Approved Development |
| Representations:      | Nil  |
| Performance criteria: | Schedule 1 - Conservation of Cultural Heritage Values, Schedule 7 - Demolition   |

---

**1. Executive Summary**

- 1.1 Planning approval is sought for Partial Demolition, Alterations and Extension to Previously Approved Development at 34 Davey Street (also known as Parliament Square).
- 1.2 More specifically the proposal is for an extension and alterations to the Murray Street wing of the Parliament Square development, to create an additional hotel floor and includes amendments to the roof structure. The maximum height of the extended building is 17.26m.
- 1.3 The proposal relies on performance criteria to satisfy the following standards and codes:
  - 1.3.1 Schedule 1 - Conservation of Cultural Heritage Values
  - 1.3.2 Schedule 7 - Demolition
- 1.4 No representations were received during the statutory advertising period between 16 and 30 November 2018.
- 1.5 The proposal is recommended for refusal on heritage grounds.

- 1.6 The final decision is delegated to the Council.

**2. Site Detail**

- 2.1 The site is 34 Davey Street, also known as Parliament Square, which is currently being redeveloped. It contains the completed Salamanca Office Building, and the remaining hotel and other commercial uses which are under construction. This application relates to the Murray Street wing of the development.

*Figure 1: The site is bordered in blue. Note the image shows the Salamanca Office Building under construction, which is now completed, and it shows the building at 10 Murray Street in situ, which has now been demolished.*

*Figure 2: The location of the Murray Street wing, looking south east down Murray Street from Davey Street.*

*Figure 3: The location of the Murray Street wing, looking north west up Murray Street from opposite its intersection with Despard Street.*

### 3. Proposal

- 3.1 Planning approval is sought for for Partial Demolition, Alterations and Extension to Previously Approved Development at 34 Davey Street (also known as Parliament Square).
- 3.2 More specifically the proposal is for an extension and alterations to the Murray Street wing of the Parliament Square development, to create an additional hotel floor and includes amendments to the roof structure. The maximum height of the extended building is 17.26m.

*Figure 4: Showing the approved arrangement of the Murray Street Wing.*

*Figure 5: Showing the approved arrangement of the Murray Street Wing.*

Figure 6: Showing the proposed arrangement of the Murray Street Wing.

Figure 7: Showing the proposed arrangement of the Murray Street Wing.

#### 4. Background

- 4.1 The Parliament Square project was approved via the *Parliament Square Planning Act 2012* (the Parliament Square Act) as Permit Number PLN-10-00495-01. Section 6A of the Parliament Square Act allows the making of a new application to the Council for a use and development substantially related to the planning permit.

- 4.2 The residential hotel was originally approved by the Council in October 2015 under PLN-15-01151-01. Alterations to the hotel were approved under delegation in 2017 under PLN-17-271.
- 4.3 The extension and alterations proposed in this application originally formed part of a section 56 (minor amendment) application submitted to the Minister for Planning, pursuant to the Parliament Square Act. The Minister would not approve the extension and alterations as a section 56 minor amendment, and as a consequence they require separate planning approval. This application (PLN-18-798) seeks that separate planning approval for the extension and alterations. Various other changes to the proposal are being considered by the Minister as a section 56 application, including the removal of the 'capsule' shaped lift on the back of the hotel building on the corner of Davey and Murray Streets.
- 4.4 The intensification of the hotel use (i.e. the increase in the number of rooms) was approved by Council in July 2018 under delegation pursuant to section 58 of the *Land and Use Planning and Approvals Act 1993* under PLN-18-276. That application (PLN-18-276) was determined prior to the Minister refusing to approve the extension and alterations as a minor amendment.

## 5. Concerns raised by representors

- 5.1 No representations were received during the statutory advertising period between 16 and 30 November 2018.

## 6. Assessment

- 6.1 The *Sullivans Cove Planning Scheme 1997* is a performance based planning scheme. This approach recognises that there are in many cases a number of ways in which a proposal can satisfy desired environmental, social and economic standards. In some cases a proposal will be 'permitted' subject to specific 'deemed to comply' provisions being satisfied. Performance criteria are established to provide a means by which the objectives of the Planning Scheme may be satisfactorily met by a proposal. Where a proposal relies on performance criteria, the Council's ability to approve or refuse the proposal relates only to the performance criteria relied on.
- 6.2 The site is located in the Sullivans Cove Mixed Use Activity Area of the *Sullivans Cove Planning Scheme 1997*.

- 6.3 The existing approved use of the Murray Street wing is a residential hotel, which is a permitted use in the Activity Area. No change of use is proposed.
- 6.4 The proposal has been assessed against:
- 6.4.1 Parts A and B – Strategic Framework
  - 6.4.2 Part D – Clause 2.0 – Activity Area Controls
  - 6.4.3 Part E – Schedule 1 – Conservation of Cultural Heritage Values
  - 6.4.4 Part E – Schedule 2 – Urban Form
  - 6.4.5 Part E – Schedule 5 – Traffic, Access and Parking
- 6.5 The proposal relies on the following performance criteria to comply with the applicable standards:
- 6.5.1 Conservation of Cultural Heritage Values - clauses 22.4.5 and 22.5.5
  - 6.5.2 Demolition - clause 28.3.1
- 6.6 Each performance criterion is assessed below.
- 6.7 Conservation of Cultural Heritage Values - Clause 22.4.5
- 6.7.1 The building at 12 Murray Street is heritage listed under the planning scheme. The proposal has been assessed by the Council's Senior Cultural Heritage Officer, who recommends the application be refused. The officer's assessment follows. Note the officer's full report is provided at Attachment C to this report.

#### Proposal

The proposal involves construction of an additional level (Level 03) behind the existing façade of the building known as 12 Murray Street. The additional level connects with Level 03 (Presidential Suite) of the previously approved new building which replaces the former 10 Murray Street State Office building. The new work will be set back approximately 2 metres from the building façade.

#### The existing building

The existing structure is the remnant two-storey, Inter-War Gothic Revival sandstone façade of a former office building. It is well-detailed and solidly constructed, featuring a parapet, pilasters which divide the façade into three bays, and a pediment surmounting the pronounced arched entrance.

12 Murray Street was constructed as the head office of the former Hydro-Electric Department (later Commission). The building was constructed in 1921 and 1922, with the offices first occupied in July 1922. The architectural design of the building has an interesting background. It was originally intended to locate this building in Davey Street, and its Tudoresque Gothic design bore a deliberate relationship with the two other government buildings in Davey Street – the former 1847-48 St Mary's Hospital / Lands and Survey Department offices (Alexander Dawson and William Porden Kay) and the 1884 Government Printing Office / Public Works Department building (William Waters Eldridge) – both representing similar architectural vocabulary. It was envisaged that the Hydro-Electric Department offices would complement the suite of Davey Street government buildings. Issues related to site and foundation conditions forced relocation of the Hydro-Electric Department offices to its Murray Street site. The Gothic design was retained – probably appearing somewhat 'old-fashioned' by 1922.

The Hydro-Electric Department building was constructed during an important phase in the expansion of electricity generation and distribution throughout Tasmania, and was the first time the department had its own building (it had previously leased office space). The rear of the building was utilitarian, in contrast to the relatively ornate façade.

The building is recognised as a Place of Cultural Significance in Table 1 of Schedule 1 of the *Sullivans Cove Planning Scheme 1997*. It is also on the Tasmanian Heritage Register.

#### The Planning Scheme

Schedule 1 of the *Sullivans Cove Planning Scheme 1997* includes the following submission requirements:

##### 22.4.3 Submission Requirements

*All applications for 'building or works' must satisfy the relevant submission requirements of clause 9.2 of the Scheme. In addition, pursuant to s.54 of the Land Use Planning and Approvals Act 1993, the following information may be required:*

- *A Conservation Plan as defined in Clause 22.3.*
- *Street elevations or 'true perspectives' to show the scale and impact of 'building or works' on places of cultural significance.*

In this instance, a separate conservation plan was not requested or submitted, as one had been previously submitted (Parliament Square, Hobart – Conservation Management Plan, January 2009.)

The Conservation Plan recognises the significance of 12 Murray Street and its relationship with the two other Gothic-styled sandstone government buildings. It also notes its historical importance in terms of the Hydro-Electric Department (later Commission). The Conservation Plan states that the 'style, scale and materials [of 12 Murray Street] reflect a desire to create a harmonious governmental precinct.'

The Conservation Plan states that the façade must be retained with a high degree of external integrity and conservation. (7.3.2)

The exterior appearance of the site, which is a result of the existing form, external surfaces, materials and finishes of significant facades, should be preserved. ... No new work should compromise the original significant facades. (7.4.1)

Where it is necessary to modify a façade, changes to the façade should reinforce the composition of the original façade. (7.4.2)

Despite the favourable assessment of the Heritage Impact Statement prepared by Design 5 – Architects Pty Ltd and submitted in support of the proposal, the proposal is not considered to be in compliance with the policies espoused in the Conservation Plan.

#### Relevant Scheme Provisions

##### 22.4.5 'Discretionary' 'Building or Works'

*'Building or works' on places of cultural significance which cannot satisfy the 'deemed to comply' provisions of Clause 22.4.4 may be approved at the discretion of the Planning Authority.*

*The following criteria must be taken into consideration in the assessment of all proposals to undertake 'building or works' on places of cultural significance:*

- *'Building or works' must complement and contribute to the cultural significance, character and appearance of the place and its setting;*
- *'Building or works' must be in compliance with the conservation strategy of an approved Conservation Plan, where required and/or provided;*
- *The location, bulk and appearance of 'building or works' must not adversely affect the heritage values of any place of cultural significance;*
- *'Building or works' must not reduce the apparent authenticity of places of cultural significance by mimicking historic forms;*
- *'Building or works' may be recognisable as new but must not be individually prominent;*
- *The painting of previously unpainted surfaces is discouraged.*

#### Assessment

The proposed works do not complement and contribute to the cultural significance, character and appearance of the place. The proposed work is an incompatible contemporary addition, destroying the architectural expression of the existing building and its historical relationship with other former government buildings. The historic façade will appear nothing more than just a façade – a 'postage stamp' on the overall envelope of new development.

The proposal does not comply with the conservation strategy of the submitted Conservation Plan.

The location, bulk and appearance of the proposed work will adversely affect the heritage values of the existing façade, altering the relationship of the parapet with the space beyond, and providing an incongruent element which will inevitably be more closely associated visually with the adjacent new development, reducing the appearance of the façade to that of an ill-fitting mask.

The proposal fails to meet key conservation provisions, and warrants refusal.

#### Tasmanian Heritage Council

The Tasmanian Heritage Council has granted conditionally consent to the proposed works. The conditions relate to:

1. Archaeology.

2. Protection of façade.
3. Relationship of new floors to existing façade.
4. 2m setback and façade design issues.

Section 39 (9) of the *Historic Cultural Heritage Act 1995* sets out requirements of the planning authority if the Heritage Council consents to the discretionary permit being granted subject to the conditions specified in the notification (as in this case):

*(9) If subsection (6)(b) applies and the relevant planning authority grants the discretionary permit –*

*(a) it must do so subject to (at least) the conditions required by the Heritage Council; and*

*(b) it must not make the discretionary permit subject to a condition that conflicts with any condition required by the Heritage Council.*

Notwithstanding the consent of the THC, the planning authority is not bound to approve the proposed works. The planning authority may still refuse to grant the discretionary permit, and ultimately, this is considered to be the appropriate course.

#### Reasons for refusal

The proposal fails to comply with the requirements of clause 2.4.5 'Discretionary' 'Building or Works' of the Sullivans Cove Planning Scheme 1997 as:

1. It does not complement and contribute to the cultural significance, character and appearance of the place.
2. It does not comply with the conservation strategy of the submitted Conservation Plan.
3. The location, bulk and appearance of the proposed work will adversely affect the heritage values of the existing façade.

6.7.2 Based on the assessment of the Council's Senior Cultural Heritage Officer, the proposal does not comply with the performance criterion, and is recommended for refusal on that basis.

6.8 Demolition - Clause 28.3.1

6.8.1 The proposal requires minor demolition to facilitate the extension and alterations to the Murray Street wing.

- 6.8.2 Clause 28.3.1 of the planning scheme states that all demolition is discretionary.
- 6.8.3 Clause 28.6 sets out the matters to be considered in relation to any proposed demolition, as follows:
- *The impact of the proposed demolition on the character of the Activity Area;*
  - *The impact of the proposed demolition on the cultural heritage values of the Cove; and*
  - *The need to avoid creation of vacant sites and 'lost space' in the Cove.*
- 6.8.4 The proposed demolition is minor and will not have a deleterious impact on the character of the Activity Area, and will not create a vacant site or lost space in the Cove. The Council's Senior Cultural Heritage Officer has not raised any objection to the impact of the proposed demolition on the cultural heritage values of the Cove.

## 7. Discussion

- 7.1 Planning approval is sought for Partial Demolition, Alterations and Extension to Previously Approved Development, at 34 Davey Street, also known as Parliament Square.
- 7.2 The application was advertised and no representations were received.
- 7.3 The proposal has been assessed against the relevant provisions of the planning scheme and is considered to not perform well with respect to the Conservation of Cultural Heritage Values Schedule. The Council's Senior Cultural Heritage Officer has assessed the proposal and recommended refusal.
- 7.4 The Tasmanian Heritage Council has approved the application subject to conditions. The Notice of Heritage Decision is provided as part of the CPC Agenda Documents at Attachment B.
- 7.5 The proposal is recommended for refusal.

## 8. Conclusion

- 8.1 The proposed Partial Demolition, Alterations and Extension to Previously Approved Development at 34 Davey Street, Hobart does not satisfy the relevant provisions of the *Sullivans Cove Planning Scheme 1997*, and as such is recommended for refusal.

## 9. Recommendations

That: Pursuant to the *Sullivans Cove Planning Scheme 1997*, the Council refuse the application for Partial Demolition, Alterations and Extension to Previously Approved Development at 34 Davey Street, Hobart for the following reason:

- 1 The proposal does not meet the 'permitted' building or works' provision or the 'discretionary building or works provision at clauses 22.4.4 and 22.4.5 of the *Sullivans Cove Planning Scheme 1997* in relation to the listed place at 12 Murray Street because: (a) It does not complement and contribute to the cultural significance, character and appearance of the place; (b) It does not comply with the conservation strategy of the submitted Conservation Plan; and (c) The location, bulk and appearance of the proposed work will adversely affect the heritage values of the existing façade.

REGISTERED PLACE NO: 2287, 7149, 2286 and 2544  
FILE NO: 15-18-46THC  
APPLICANT: Citta  
DATE: 11 December 2018

## NOTICE OF HERITAGE DECISION

(*Historic Cultural Heritage Act 1995*)

The Place: Parliament Square, 34 Davey Street, Hobart.  
The Registered Places: Former St Mary's Hospital, 36 Davey Street, Hobart.  
Former Government Printing Office, 34 (West) Davey Street, Hobart.  
Dept. of Health and Community Services Offices, 34 Davey Street, Hobart.  
Former HEC Office, 12 Murray Street, Hobart.  
Proposed Works: Partial demolition, alterations and extension to previously approved development.

Under section 39(6)(b) of the *Historic Cultural Heritage Act 1995*, the Heritage Council gives notice that it consents to the discretionary permit being granted in accordance with the documentation submitted with Development Application PLN-18-798, advertised on 16/11/2018, subject to the following conditions:

- I. **An archaeological method statement (AMS) is to be prepared for the recovery of any artefacts and recording of features of archaeological significance that may be uncovered on the site of 12 Murray Street in the course of its excavation. The AMS must be consistent with the approach outlined in the Tasmanian Heritage Council's Practice Note No 2 (version 4, November 2014) *MANAGING HISTORICAL ARCHAEOLOGICAL SIGNIFICANCE IN THE WORKS PROCESS*. This AMS must be submitted to and endorsed by Heritage Tasmania's Works Manager prior to the commencement of excavation work at 12 Murray Street. The AMS must cover the extent of the building footprint of the building that most recently occupied 12 Murray Street.**
  - (ii) **Archaeological recovery and recording work must be carried out in accordance with the endorsed AMS.**

Reason for condition

To ensure that the archaeological values of the registered place are appropriately managed.

2. The façade of 12 Murray Street is to be securely retained and protected from damage during demolition works; and, any damage to the façade shall be made good using construction methods and materials that Heritage Tasmania's Works Manager is satisfied are appropriate for the conservation of the façade's heritage values, prior to occupation of the rebuilt building on this part of the site.

Reason for condition

To ensure that this significant façade is protected and retained.

3. Any concrete floors in the new structure at 12 Murray Street must be detailed such that the junctions between the slab and existing masonry walls are constructed:
- (a) To not result in the transfer of moisture or the introduction of soluble salts from new concrete into the stonework of the heritage façade of 12 Murray Street; and,
  - (b) To enable the evaporation of moisture from the ground at the base of the heritage façade of 12 Murray Street.

A dimensioned and notated sectional drawing that meets the above requirements must be submitted to Heritage Tasmania and be to the Works Manager's satisfaction before construction of new floors commence.

Reason for condition

To avoid any circumstances that may cause or exacerbate rising damp in the masonry of the heritage façade at 12 Murray Street.

4. The new Level 2 and 3 extension to 12 Murray Street must be designed such that:
- (a) The new work is set back a minimum of 2 metres from the face of the sandstone façade of 12 Murray Street; and,
  - (b) The roof and wall design must present a minimal profile (i.e. devoid of eye-catching detail); and,
  - (c) The wall cladding must be of a transparent material or materials that have a visually recessive colour when viewed against the backdrop of an ordinary daytime sky.

A dimensioned and notated sectional drawing that meets the above requirements must be submitted to Heritage Tasmania and must be to the Works Manager's satisfaction before construction work to this part of the building commences.

Reason for condition

To ensure that the new upper level extension does not create undue visual distraction from the façade of 12 Murray Street and thereby diminish the heritage value of this facade.

Advice

It is recommended that the applicant contacts Heritage Tasmania as soon as possible to discuss the requirements of Condition 1 of this Notice, and the requirements of the Heritage Council's consent for Works Application 5292 (PLN-12-271).

Please ensure the details of this notice, including the conditions and advice, are included in any permit issued, and forward a copy of the permit or decision of refusal to the Heritage Council for our records.

Please contact Deirdre Macdonald on 6165 3712 if you require clarification of any matters contained in this notice.

## PARLIAMENT SQUARE —

Date  
05/11/2018

Hobart City Council  
16 Elizabeth Street  
Hobart  
TAS 7000

Attention: Mr Ben Ikin

Letter Ref: HCC18005

Dear Sir,

**Parliament Square Redevelopment Project  
Planning Permit Application – Alterations to Approved Development – Murray  
Street**

Please find attached our application for a planning permit for alterations to the Parliament Square development. In support of this application please find attached the following documents:

1. Planning Assessment Report by AllUrban Planning dated 31 October 2018
2. Drawings by FJMT architects:
  - DA-CH-1202 Murray Street and Backdrop to Parliament House
  - DA-CH-1302 East/West and North Sections
  - DA-CH-2013 Visibility over Parliament House – 3D Perspectives
  - DA-CH-1108 Level 3
  - DA-CH-1109 Level 4
3. Heritage Impact Statement by Design 5 Architects dated 02 May 2018 (refer relevant section as highlighted).

Should you have any further queries or require any further information regarding this matter, please contact the undersigned.

Yours sincerely,

Shaun Wilson

Jennifer Cooper  
Citta Hobart Pty Ltd  
49A Davey Street  
HOBART Tas 7000

Dear Jennifer,

### **Parliament Square**

#### **New application for a planning permit - Alterations to approved development – Murray Street wing**

All Urban Planning Pty Ltd has been engaged by Citta Property Group Pty Ltd to prepare a planning assessment for a new application for a planning permit for alterations to the Parliament Square development under planning permit PLN-17-271. The proposal is for alterations and extensions to the Murray Street wing to add an additional hotel floor and amendments to the roof structure as shown on the following plans:

- DA-CH-1202 Murray Street & Backdrop to Parliament House
- DA-CH-1302 East/West & North Sections
- DA-CH-2013 Visibility Over Parliament House - 3D perspectives
- DA-CH-1108 Level 3 Plan
- DA-CH-1109 Level 4 Plan

The proposal follows Further Permit PLN-18-276 for Alterations to and intensification of use for previously approved development issued by Hobart City 18 July 2018. This permit increased the number of hotel rooms in 34 Davey Street and 12 Murray Street by 24 to a total of 152 rooms. This proposal does not alter the number of hotel rooms approved under that permit.

No changes are proposed to car parking or vehicle access to the site.

### **Background**

The Parliament Square project was approved via the Parliament Square Planning Act (Parliament Square Act) as Permit Number PLN10-00495-01 (the planning permit).

Section 6A of the Parliament Square Act 2012 allows the making of a new application to Hobart City Council for a use and development substantially related to the planning permit.

### **Planning Assessment**

A residential hotel is a permitted use on Murray Street under the Use table 16.3.1 of the planning scheme.

12 Murray Street is heritage listed under the planning scheme and Tasmanian Heritage Register.

The proposed upper level extension on the Murray Street frontage would remain below the permitted height of 18m (a maximum height of 17.26m is proposed setback and 17.01m at highest point on the street front as shown on DA-CH-1202) and complies with Clause 23.6.1A of the planning scheme.

The extension to the upper level of the building is subject to discretionary consideration under Clause 22.4.5 of Schedule 1 – Conservation of Cultural Heritage Values of the planning scheme including evaluation of the following:

- *'Building or works' must complement and contribute to the cultural significance, character and appearance of the place and its setting;*
- *'Building or works' must be in compliance with the conservation strategy of an approved Conservation Plan, where required and/or provided;*
- *The location, bulk and appearance of 'building or works' must not adversely affect the heritage values of any place of cultural significance;*
- *'Building or works' must not reduce the apparent authenticity of places of cultural significance by mimicking historic forms;*
- *'Building or works' may be recognisable as new but must not be individually prominent;*

#### Assessment

The HIA confirms that the design of the upper level is not individually prominent and complements and contributes to the cultural heritage significance of 12 Murray Street. It therefore satisfies Clause 22.4.5.

I would be pleased to explain or discuss further as necessary

Regards

## DESIGN 5

A R C H I T E C T S

PARLIAMENT SQUARE, HOBART  
Proposed Alterations to Approved Development

HERITAGE IMPACT STATEMENT  
Combined Hotel Development Application  
2 May 2018

**1. BACKGROUND**

Design 5 – Architects have been involved with the scheme proposed by Citta Property Group from the initial tender stage to the present. As heritage architect in the project team, we have been working collaboratively with the project architects Francis-Jones Morehen Thorp (fjmt) throughout the design development, documentation, and now construction process. We have prepared the Heritage Impact assessments for all previous applications regarding this project.

This present proposal has been developed in collaboration with Design 5 – Architects.

**1.1 Summary of amendments and additions proposed to approved development**

This proposal to alter and add to the original development, as amended by subsequent approvals, is a result of ongoing refinements to the combined hotel proposal. It comprises proposed modifications to the new and existing building elements, and new additions. Those changes that have potential heritage impacts include the following:

**12 Murray Street:**

- Additional floor accommodating hotel rooms, and amendments to the roof structure
- Change of use to re-assembled Blackwood Rooms from hotel suite to meeting rooms

**34 Davey Street:**

- Deletion of external glass lift, and reconfiguration of internal passenger and goods lift arrangements and back-of-house stair

**36 Davey Street:**

- New opening in Salamanca Place façade

**Red Brick Building:**

- Modifications to roof form over bar / dining area

**1.2 Documents referenced**

The proposed Alterations to the Approved Development considered in this report are described in documents prepared by FJMT, specifically the drawings numbered:

5-13 Queen Street, Chippendale NSW 2008

**1.3 Report structure**

The report is set out in the following manner:

- Part 1. Introduction
- Part 2. Cultural significance – summary
- Part 3. Summary description of proposed amendments and discussion of impacts
- Part 4. Summary conclusion of the heritage impact of the proposal

**1.4 Author identification**

This report was prepared by Lian Wong and Alan Croker (Director) of Design 5 - Architects.

**2. CULTURAL SIGNIFICANCE - SUMMARY**

All of the existing buildings affected by this proposal are listed on the Tasmanian Heritage Register.

The following summary statement of significance for the site is taken from the Parliament Square Conservation Management Plan (CMP) prepared by Architectural Projects, dated January 2009.

*The site and collection of buildings that comprise parliament square has high historical significance for its ability to provide evidence of the early development patterns of Hobart and for its association with Parliament House and the development of Sullivans Cove as the place from which Australia's second oldest State capital city grew. The site has historical significance because of the ongoing continuity of use by Government Departments in occupying the site.*

*Parliament square has creative significance as a prominent collection of buildings that provide a backdrop to the setting of Parliament House and Gardens. The site is also significant as a collection of buildings that exemplify fine examples of varied taste, date, style or technology.*

*The site of parliament square has significance for its potential to yield new or further archaeological information including outbuildings, remnants of the 1900s toilet block along Salamanca Place, internal floor cavities of the former St Mary's Hospital and extensions to house various Government Offices. Parliament square has historical significance as a complete street block that has consolidated over time into long-term Government ownership over a period of 150 years. The site has social significance for its associations with the Tasmanian Government and is also considered significant as an integral part of the wider historic Sullivans Cove, that is still largely intact and is used daily by the people of Hobart for commercial, cultural and recreational purposes.*

*Parliament square has historical associative significance because of its association with Parliament House that has high heritage value for its association with groups and individuals of the highest significance in the history of Tasmania, including all Tasmanian members of Parliament since the 1840s.*

*Parliament square and Parliament House are also significant for their association with prominent architects John Lee Archer, William Porden Kay, SWT Blythe and Hartley Wilson and Bolt.*

### 3. SUMMARY DESCRIPTION OF PROPOSED AMENDMENTS AND DISCUSSION OF IMPACTS

The heritage impacts on each of the proposed amendments are discussed below.

#### 3.1 12 Murray Street

##### **Additional floor accommodating hotel rooms, and amendments to the roof structure**

An additional floor is proposed to 12 Murray Street, extending the full width of the building.

In order to minimise the overall height of the new building, several strategies were employed. Whilst the Level 1 finished floor level (FFL) is proposed to be the same as the currently approved scheme, the new Level 2 FFL will be lowered. The approach for accommodating services to the hotel rooms has been modified to minimise the depth of the floor plates, ensuring the windows of the stone façade are not concealed as a result of the lowered FFL.

The façade of the new second and third floors are glazed and of a simple minimal design, so it forms a visually recessive backdrop behind the sandstone façade. The roof form has been simplified so the overall building height is minimised. A small section is raised above the main roof line to accommodate services only where required, and set back so it is not visible from the street. We note the proposed design of the front edge of the roof is in accordance with Condition 8 of the Tasmanian Heritage Council Notice of Heritage Decision for Planning Permit PLN-17-271.

The section of new building to the east of the stone façade is proposed to be increased to 3 storeys above street level and a rooftop terrace. Although the parapet height of this section is now higher than the stone façade adjacent, the design of the new façade has been modified to lessen the visual impact. A slightly recessed section directly adjacent to the stone façade helps the bulk of the new façade read as a separate element, so the stone façade is not visually dominated. Furthermore, the design of this new facade matches that of the new floors above 34 Davey Street, helping unify the components across the site.

The internal re-planning of hotel rooms is associated with the additional floor is considered to have a neutral impact.

As with the approved design, the new proposal constitutes a clear and modern addition to the retained building, floating free of the façade and respecting its architecture, symmetry and prominence. Although higher than the currently approved design, it is our opinion that the strategies employed to keep the additional height to a minimum are successful in minimising the impact on the heritage significance of this façade, and this proposed design is supported.

##### **Change of use to re-assembled Blackwood Rooms from hotel suite to meeting rooms**

As a result of internal re-planning associated with the proposed additional floor, an opportunity arose to use the Blackwood Rooms as meeting rooms rather than hotel rooms as per the approved design.

This is considered a highly positive change, as the proposed use is now aligned with the original use of these rooms, allowing the significant joinery to be appreciated in the context for which they were designed, and by a broader audience. Another benefit is that fewer modifications to the joinery will be required to accommodate services for meeting rooms rather than hotel rooms. The proposed change of use is supported.

### 3.2 34 Davey Street

#### **Deletion of external glass lift, and reconfiguration of internal passenger and goods lift arrangements and back-of-house stair**

The current approved scheme includes a new goods lift at the southern end of 34 Davey Street and a new external glass lift on the eastern (plaza) side of 34 Davey Street. In this proposed amendment, the glass lift is deleted and replaced with two new passenger lifts in a new lift shaft to the north of the Davey Street entry. The existing lift shaft at the centre of the southern stairwell (with a new lift car) is reused for the goods lift.

The existing lift shaft is too small to accommodate a dedicated goods lift, so it was to be used as a services riser in the approved scheme, however an operational decision was made to accept a slightly smaller new lift car in the proposed scheme. This is considered a positive change, as it retains the integrity of the originally designed stairwell and lift shaft.

The new internal lift shaft is proposed to be offset from the inside face of the western façade, to accommodate window dressing and backlighting to enable this bank of windows to remain visually 'active' from the outside. We believe the change to the façade will be of negligible impact. Some internal re-planning of hotel rooms is required as a result of the reconfiguration of the lifts, which will have a neutral impact.

In the current approval, the new back-of-house stair from Lower Ground to Ground Floor is incorporated into the existing southern lift shaft and stairwell. Recent test pits have revealed a large concrete beam at the base of this existing structure. The structural engineers have advised that accommodating a new stair in this area would be complex and costly, as well as creating the risk of potential disturbance to the existing stairwell and glass block façade. In this proposed amendment, the back-of-house stair is relocated to the eastern (plaza) side of the main façade. This will project forward of the façade, but is confined to one level only, remaining below the new awning. It is therefore considered to be of minimal visual impact, and outweighed by the benefit of mitigating risk of disturbance the glass block façade.

Although the eastern façade of 34 Davey is not highly significant, the deletion of the external glass lift allows the façade to be viewed more clearly and with fewer obstructions. In lieu of new full size openings connecting each floor with the external glass lift, modified window openings are proposed. These are consistent in size with the existing windows to the north, and we recommend a design of a slightly different configuration in order to reference the existing (smaller) openings. The impact of this change can be considered positive, and the overall changes to the lifts and stair are supported.

### 3.3 36 Davey Street

#### **New opening in Salamanca Place facade**

In this proposal, a new opening is proposed to the Ground Floor of the Salamanca Extension, to provide direct access between the Whisky Bar and the external passageway adjacent to Salamanca Place. This is in a different location to the new opening originally proposed and approved (and subsequently deleted in the currently approved scheme), and is narrower, however it follows the same principles. The new opening is centred below the windows above, respecting the order and regularity of the architecture. It is proposed to be within a new steel portal frame, allowing it to be read as a clearly new insertion, consistent with others across the site. Furthermore, this new opening is opposite the existing gate to Salamanca Place, so a new opening in the stone fence is no longer required.

The new opening will help provide a more direct connection between Salamanca Place and the public use of the internal space within the building, helping enliven the streetscape. Although the new opening will have high impact on the significant fabric of the place, this impact is considered to be outweighed by the benefit to the streetscape and longer term viability of the proposed use, and is therefore supported.

### 3.4 Red Brick Building

#### Modifications to roof form over bar/dining area

The design of the roof over the bar / dining area is proposed to be modified following a review of thermal comfort and Environmentally Sustainable Design requirements, as well as refinements to the kitchen exhaust system. The proposed design retains the green roof and edge detail the approved design, but part of the glazed roof is replaced with a solid roof. Skylights are incorporated into this section of the roof within truncated pyramids, which are echoed by the form of the kitchen exhaust within the green roof.

As discussed in the previous Heritage Impact Statement, the stone facades of 34 West and 36 Davey Street are of high significance, and the Red Brick Building is of low significance, with parts of it deemed intrusive. While it is important to retain evidence of the evolution of the buildings and site, it is also important to acknowledge the hierarchy of heritage significance. That is, the detailing of the new and modified elements of the Red Brick Building should not obstruct, but rather help facilitate this connection with the stone buildings behind it.

We note the roof over the bar / dining area retains a glazed perimeter, helping articulate the separation between the Red Brick Building and stone buildings adjacent, while also meeting thermal comfort and ESD requirements. The principle of the design is largely the same as the approved design, and is considered to be of neutral impact so the proposed change is supported. However, further detailed resolution of the fenestration and roof edge is required, to maximize the feelings of 'openness' and 'lightness' of the Red Brick Building, ensuring the stone buildings are legible from the plaza when viewed aurally from the Salamanca tower.

### 4. SUMMARY CONCLUSION

The design development of the combined hotel scheme has some additional impacts to the heritage significance of the place, but most are of negligible or neutral impact, and overall, the proposed changes are considered acceptable.

The additional floor to 12 Murray Street is the most significant change to the scheme, but we consider the proposed elevation to have been thoughtfully designed in terms of respecting the heritage significance of the original stone façade. In our opinion, the impact of the additional floor has been minimised such that we can support the proposed design. The change of use of the Blackwood Rooms from hotel rooms to meeting rooms is highly positive.

The deletion of the external glass lift from 34 Davey Street and reconfiguration of internal lifts is of neutral to positive impact. The amended back-of-house stair is of minimal impact, but considered to be outweighed by the benefit of mitigating risk of disturbance to the existing glass block façade.

The new opening in the Salamanca Place façade will have a high impact on the significant fabric of the place, but is considered to be outweighed by benefits to the streetscape and precinct.

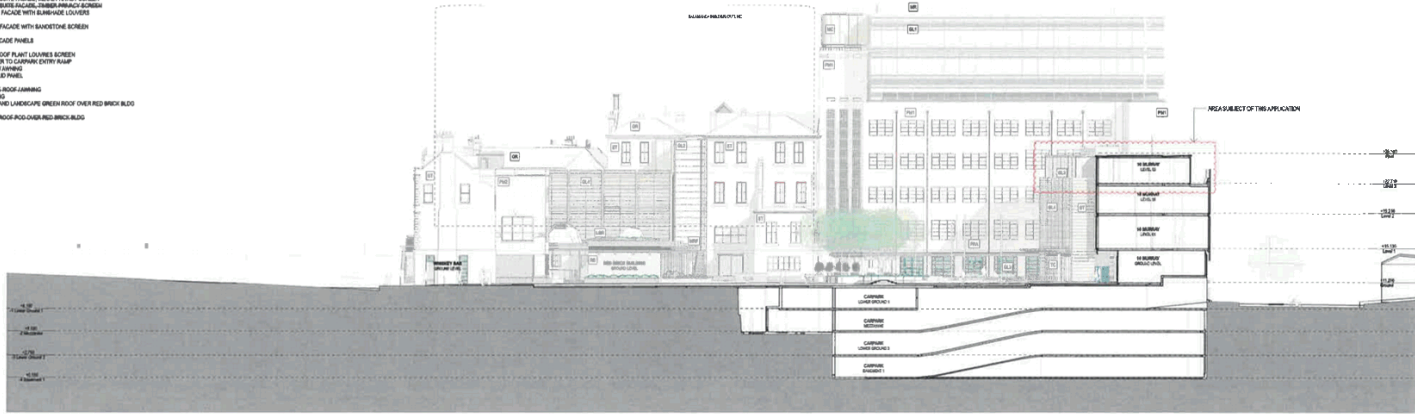

The modifications to the Red Brick Building roof are of neutral impact.

Overall, the proposal to alter the existing development approval is supported, but it is essential that the recommendations made in this Heritage Impact Statement are implemented to minimise any adverse impacts.

**Notes and Report:**

- Bearing datum is GDA 94, per connection between SPMs 8966, SPM 8978.
- Horizontal coordinate datum is MGA per SPM 8966.
- Adopted sea level correction of 1.0000 and scale factor of 0.99961. This results in a combined factor of 0.99961
- Corners have been adopted per occupation where not defined previously.
- Method of survey - Conventional traverse.
- All boundaries are open unless otherwise stated

### Referral Officer comments:

#### Proposal

The proposal involves construction of an additional level (Level 03) behind the existing façade of the building known as 12 Murray Street. The additional level connects with Level 03 (Presidential Suite) of the previously approved new building which replaces the former 10 Murray Street State Office building. The new work will be set back approximately 2 metres from the building façade.

#### The existing building

The existing structure is the remnant two-storey, Inter-War Gothic Revival sandstone façade of a former office building. It is well-detailed and solidly constructed, featuring a parapet, pilasters which divide the façade into three bays, and a pediment surmounting the pronounced arched entrance.

12 Murray Street was constructed as the head office of the former Hydro-Electric Department (later Commission). The building was constructed in 1921 and 1922, with the offices first occupied in July 1922. The architectural design of the building has an interesting background. It was originally intended to locate this building in Davey Street, and its Tudoresque Gothic design bore a deliberate relationship with the two other government buildings in Davey Street – the former 1847-48 St Mary's Hospital / Lands and Survey Department offices (Alexander Dawson and William Porden Kay) and the 1884 Government Printing Office / Public Works Department building (William Waters Eldridge) – both representing similar architectural vocabulary. It was envisaged that the Hydro-Electric Department offices would complement the suite of Davey Street government buildings. Issues related to site and foundation conditions forced relocation of the Hydro-Electric Department offices to its Murray Street site. The Gothic design was retained – probably appearing somewhat 'old-fashioned' by 1922.

The Hydro-Electric Department building was constructed during an important phase in the expansion of electricity generation and distribution throughout Tasmania, and was the first time the department had its own building (it had previously leased office space). The rear of the building was utilitarian, in contrast to the relatively ornate façade.

The building is recognised as a Place of Cultural Significance in Table 1 of Schedule 1 of the *Sullivans Cove Planning Scheme 1997*. It is also on the Tasmanian Heritage Register.

#### The Planning Scheme

Schedule 1 of the *Sullivans Cove Planning Scheme 1997* includes the following submission requirements:

#### **22.4.3 Submission Requirements**

All applications for 'building or works' must satisfy the relevant submission requirements of clause 9.2 of the Scheme. In addition, pursuant to s.54 of the *Land Use Planning and Approvals Act 1993*, the following information may be required:

- A Conservation Plan as defined in Clause 22.3.
- Street elevations or 'true perspectives' to show the scale and impact of 'building or works' on places of cultural significance.

In this instance, a separate conservation plan was not requested or submitted, as one had been previously submitted (*Parliament Square, Hobart – Conservation Management Plan, January 2009.*)

The Conservation Plan recognises the significance of 12 Murray Street and its relationship with the two other Gothic-styled sandstone government buildings. It also notes its historical importance in terms of the Hydro-Electric Department (later Commission). The Conservation Plan states that the 'style, scale and materials [of 12 Murray Street] reflect a desire to create a harmonious governmental precinct.'

The Conservation Plan states that the façade must be retained with a high degree of external integrity and conservation. (7.3.2)

The exterior appearance of the site, which is a result of the existing form, external surfaces, materials and finishes of significant facades, should be preserved. ... No new work should compromise the original significant facades. (7.4.1)

Where it is necessary to modify a façade, changes to the façade should reinforce the composition of the original façade. (7.4.2)

Despite the favourable assessment of the Heritage Impact Statement prepared by Design 5 – Architects Pty Ltd and submitted in support of the proposal, the proposal is not considered to be in compliance with the policies espoused in the Conservation Plan.

#### **Relevant Scheme Provisions**

##### **22.4.5 'Discretionary' 'Building or Works'**

'Building or works' on places of cultural significance which cannot satisfy the 'deemed to comply' provisions of Clause 22.4.4 may be approved at the discretion of the Planning Authority.

The following criteria must be taken into consideration in the assessment of all proposals to undertake 'building or works' on places of cultural significance:

- 'Building or works' must complement and contribute to the cultural significance, character and appearance of the place and its setting;
- 'Building or works' must be in compliance with the conservation strategy of an approved Conservation Plan, where required and/or provided;

- The location, bulk and appearance of 'building or works' must not adversely affect the heritage values of any place of cultural significance;
- 'Building or works' must not reduce the apparent authenticity of places of cultural significance by mimicking historic forms;
- 'Building or works' may be recognisable as new but must not be individually prominent;
- The painting of previously unpainted surfaces is discouraged.

### Assessment

The proposed works do not complement and contribute to the cultural significance, character and appearance of the place. The proposed work is an incompatible contemporary addition, destroying the architectural expression of the existing building and its historical relationship with other former government buildings. The historic façade will appear nothing more than just a façade – a 'postage stamp' on the overall envelope of new development.

The proposal does not comply with the conservation strategy of the submitted Conservation Plan.

The location, bulk and appearance of the proposed work will adversely affect the heritage values of the existing façade, altering the relationship of the parapet with the space beyond, and providing an incongruent element which will inevitably be more closely associated visually with the adjacent new development, reducing the appearance of the façade to that of an ill-fitting mask.

The proposal fails to meet key conservation provisions, and warrants refusal.

### Tasmanian Heritage Council

The Tasmanian Heritage Council has granted conditionally consent to the proposed works. The conditions relate to:

1. Archaeology
2. Protection of façade
3. Relationship of new floors to existing façade
4. 2m setback and façade design issues

Section 39 (9) of the *Historic Cultural Heritage Act 1995* sets out requirements of the planning authority if the Heritage Council consents to the discretionary permit being granted subject to the conditions specified in the notification (as in this case):

*(9) If subsection (6)(b) applies and the relevant planning authority grants the discretionary permit –*

*(a) it must do so subject to (at least) the conditions required by the Heritage Council; and*

*(b) it must not make the discretionary permit subject to a condition that conflicts with any condition required by the Heritage Council.*

Notwithstanding the consent of the THC, the planning authority is not bound to approve the proposed works. The planning authority may still refuse to grant the discretionary permit, and ultimately, this is considered to be the appropriate course.

**Reasons for refusal:**

The proposal fails to comply with the requirements of clause 2.4.5 'Discretionary' 'Building or Works' of the *Sullivans Cove Planning Scheme 1997* as:

- (a) It does not complement and contribute to the cultural significance, character and appearance of the place.
- (b) It does not comply with the conservation strategy of the submitted Conservation Plan.
- (c) The location, bulk and appearance of the proposed work will adversely affect the heritage values of the existing façade.

## 7.2 APPLICATIONS UNDER THE HOBART INTERIM PLANNING SCHEME 2015

---

### 7.2.1 2 COLLINS STREET AND ADJACENT ROAD RESERVE HOBART - DEMOLITION AND NEW DEVELOPMENT FOR VISITOR ACCOMMODATION, FUNCTION CENTRE AND ASSOCIATED FACILITIES PLN-16-1133 - FILE REF: F19/2281

---

|                    |   |
|--------------------|---|
| Address:           | 2 Collins Street and Adjacent Road Reserve<br>Hobart  |
| Proposal:          | Demolition and New Development for Visitor<br>Accommodation, Function Centre and<br>Associated Facilities |
| Expiry Date:       | 6 February 2019   |
| Extension of Time: | Not applicable  |
| Author:            | Cameron Sherriff  |

#### **RECOMMENDATION**

That pursuant to the *Sullivans Cove Planning Scheme 1997*, the Council refuse the application for demolition and new development for visitor accommodation, function centre and associated facilities at 2 Collins Street and adjacent road reserve, HOBART for the following reasons:

1. The proposed function centre does not meet the Objectives of Clause 15.2 of the *Sullivans Cove Planning Scheme 1997*, as it:
  - a) Fails to ensure that the building masses and facades appropriately relate to the spaces they form.
  - b) Fails to ensure that the proposed non-residential use is based on the amenity and characteristics of specific sites.
  - c) Fails to ensure that the amenity of or the potential for adjacent residential development will not be diminished.

and is therefore considered to be prohibited under clause 15.3.4 of the *Sullivans Cove Planning Scheme 1997*.

2. The proposal does not meet the performance standards of clause 22.5.5 of the *Sullivans Cove Planning Scheme 1997*, as:
  - a) It will dominate adjacent places of cultural significance when viewed from the street or any other public space, and will be more prominent in the street than the adjacent places of cultural significance contrary to the Cultural Resource Principles (Cultural Heritage and Urban Character) of the *Sullivans Cove Planning Scheme 1997* espoused in clause 7.3.2.
  - b) The area of the facade of the new building will exceed that of the buildings on adjacent places of cultural significance and the visual impact of the apparent disparity of scale is significant and historic precedent does not warrant the scale disparity.
  - c) The proposal fails to complement and contribute to the specific character and appearance of adjacent places of cultural significance and the historic character of the Cove generally.
  - d) The location, bulk and appearance of the proposed building will adversely affect the heritage values of adjacent and nearby places of cultural significance, by creating an incongruous backdrop out of scale with the present visual setting.
3. The proposal exceeds the 'deemed to comply' height, alignment, plot ratio, apparent size and building surfaces standards of clause 23.6.1A and 23.7.1 of the *Sullivans Cove Planning Scheme 1997* and in turn fails to meet the objectives of clause 23.2, in that:
  - a) It fails to conserve the traditional urban pattern of the Cove.
  - b) Its bulk and height does not reflect the natural topography of the Sullivans Cove Planning Area, the amphitheatre sloping down to the Cove and the Macquarie Street and Regatta Point Ridges.
  - c) It does not promote a respectful relationship between buildings and to buildings of identified cultural significance within a street.

- d) The building will be individually prominent in terms of contrast with neighbouring buildings by being significantly higher or having a larger apparent size when viewed in street elevation.
  - e) The building does not facilitate the creation of 'secondary spaces' on lots in the Cove.
4. The proposal exceeds the maximum 'permitted' height standards and exceeds the standards for apparent size of clause 23.6.1A of the *Sullivans Cove Planning Scheme 1997* and does not meet the corresponding discretionary provisions of clause 23.6.2, as it will be more prominent in the streetscape than adjacent Places of Cultural Significance, by strong contrast of scale, height, colour and tone.
5. The proposal does not meet the provisions of clause 28.5 and clause 28.6 of the *Sullivans Cove Planning Scheme 1997*, as it involves the demolition of a building which (a) contributes to the urban character of the Activity Area, and (b) is capable of continued beneficial use. The proposed demolition will have a detrimental impact on the character of the Activity Area.

---

**1. Executive Summary**

- 1.1 Planning approval is sought for Demolition and New Development for Visitor Accommodation, Function Centre and Associated Facilities at 2 Collins Street and adjacent road reserve, Hobart.

- 1.2 More specifically the proposal includes:
- The demolition of existing buildings, and the construction of a new hotel with 16 floors (plus roof and rooftop plant) including 256 hotel rooms, conference facilities including a 1000 seat conference hall, meeting spaces, two restaurants, a retail space, a pool and wellness centre, three levels of above ground carparking (167 spaces), full size coach parking and works in, over and under the Collins Street and Ragged Lane Road Reservations, including the removal of an established street tree on Collins Street.
  - The building is proposed to have a height of approximately 55 metres to the top of its rooftop plant. The total gross floor area of the proposed building is 24,270m<sup>2</sup>.
  - The proposed building is finished externally with a combination of materials - Alucabond or similar cladding; sandstone facing; powder coated steel elements; perforated mesh; Alucabond or similar louvres; off form concrete panels; curtain wall glazing; glazed window suites; and timber soffit lining for its Collins Street feature awning.
- 1.3 The proposal relies on performance criteria to satisfy the following standards and codes of the Sullivans Cove Planning Scheme 1997:
- 1.3.1 Activity Area Controls - Use
  - 1.3.2 Schedule 1 - Conservation of Cultural Heritage Values: Adjacency; Archaeology
  - 1.3.3 Schedule 2 - Urban Form: Building Form; Building Surfaces
  - 1.3.4 Schedule 3 - Public Urban Spaces
  - 1.3.5 Schedule 7 - Demolition
- 1.4 Fourteen-hundred and Fifty Nine (1459) representations to the proposal were received within the statutory advertising period between 17 August and 31 August 2018. Of these, three (3) were supportive of the proposal.
- 1.5 The proposal is recommended for refusal.
- 1.6 The final decision is delegated to the Council.

## 2. Site Detail

*Image 1: Aerial view of the subject property and surrounds.*

- 2.1 2 Collins Street, Hobart is situated on the corner of Collins Street and Brooker Avenue, with Ragged Lane running along the majority of the south-western boundary of the property. The site includes an existing warehouse-style building (formerly Roberts) occupying the north-eastern half of the property, with a carpark and a semi-enclosed former Council garage building in the south-western corner of the site. The site backs onto the site of The Old Woolstore Apartment Hotel, and residential properties of Wapping are nearby across Ragged Lane. There is a large area of paved highway reservation in front of the property at the bottom end of Collins Street that includes street trees and a prominent sculpture and water feature. 2 Collins Street has a total area of 3009m<sup>2</sup>.
- 2.2 Photos of the site and surrounds:

*Plate 1: The subject site as viewed from the intersection of Collins Street and Brooker Avenue. Note the former Roberts building to the left and the former Council garage to the right, with the green/grey Woolstore building behind.*

*Plate 2: Looking back to the site from along Collins Street. The tree in the centre of the image is proposed to be removed.*

*Plate 3: Looking up Collins Street from the opposite side of Brooker Avenue with the subject site on the left. Note the sculpture and water feature which is proposed to remain in the widened pavement of the Highway Reservation in this location.*

*Plate 4: Looking towards the site from the opposite side of the Brooker Avenue/Tasman Highway/Macquarie Street/Davey Street intersection. Note the Hospital redevelopment rising behind, and part of the Woolstore building to the left of the site.*

*Plate 5: The internal rear of the site as viewed from the end of Crewswells Row, which is adjoined by the Woolstore site and residential properties of Wapping. The former Roberts building lies in the centre of the image.*

*Plate 6: Looking up Ragged Lane towards Collins Street, with the subject site (and former Council garage building) on the right and residential properties of Wapping on the left.*

### **3. Proposal**

- 3.1 Planning approval is sought for Demolition and New Development for Visitor Accommodation, Function Centre and Associated Facilities 2 Collins Street and adjacent road reserve, Hobart..

3.2 More specifically the proposal is for:

- The demolition of existing buildings, and the construction of a new hotel with 16 floors (plus roof and rooftop plant), 256 hotel rooms, conference facilities including a 1000 seat conference hall, meeting spaces, two restaurants, a retail space, a pool and wellness centre, three levels of above ground carparking (167 spaces), full size coach parking and works in, over and under the Collins Street and Ragged Lane Road Reservations, including the removal of an established street tree on Collins Street.
- The building is proposed to have a height of approximately 55 metres to the top of its rooftop plant. The total gross floor area of the proposed building is 24,270m<sup>2</sup>.
- The proposed building is finished externally with a combination of materials - Alucabond or similar cladding; sandstone facing; powder coated steel elements; perforated mesh; Alucabond or similar louvres; off form concrete panels; curtain wall glazing; glazed window suites; and timber soffit lining for its Collins Street feature awning.

3.3 Proposal images:

Image 2: Architect's render of the proposed development (Excerpt from proposal plans).

Image 3: Collins Street Elevation (Excerpt from proposal plans).

Image 4: South East Elevation (from Woolstore) (Excerpt from proposal plans).

Image 5: Brooker Avenue Elevation (Excerpt from proposal plans).

Image 6: Ragged Lane Elevation (Excerpt from proposal plans).

#### 4. Background

- 4.1 When originally submitted in October 2016, the application was of a different, taller design than that currently being considered, being 23 floors with 479 hotel rooms and a height of around 84m to the top of rooftop plant and around 94m to the top of a spire which was part of an external design feature. Revisions to the proposal were made voluntarily by the applicant during the period where additional information was being sought by assessing officers.

- 4.2 Landlord consent was sought and granted for the associated works within the road reservations adjacent to the site in May 2017. Due to revisions made to the proposal during the period where additional information was being sought, this initial landlord consent was invalidated and the applicant was required to reapply for new consent based on the revised proposal. This secondary landlord consent was granted in April 2018.

## 5. Concerns raised by representors

- 5.1 Fourteen-hundred and Fifty-nine (1459) representations to the proposal were received within the statutory advertising period between 17 August and 31 August 2018. Of the total amount received, three (3) were supportive of the proposal.
- 5.2 The following table outlines the concerns raised in the representations received. Those concerns which relate to a discretion invoked by the proposal are addressed in Section 6 of this report.

|   |
|---|
| Lack of compliance with Scheme standards, most notably for height and plot ratio. Fails to meet the Objectives of the Scheme. The proposal will be negatively visually prominent and will impede valued sightlines from within and around the city. Poor design – monstrous, ghastly, ugly, grotesque, boring, disgraceful and disrespectful – a tacky eyesore. Lack of vision in its design with no attempt made to think creatively to produce a good development outcome. Inappropriate height, bulk and materials. The building would be an unwelcome landmark. Potentially the most hideous development ever submitted for a DA in Hobart. |
| Height limitations should be adhered to.  |
| Entirely unwelcome proposal. An insult. Insane. A sick joke. Approval would set a dangerous precedent. It is completely insensitive to its location and suggests greed above all else and a quick cash grab for overseas investors. Why has it gotten this far when it clearly acknowledges that it does not comply with applicable standards? Complete lack of understanding or consideration of what is appropriate for the area. The developer seems to be trying to take over Hobart with little regard for the rules or what is appropriate or needed. The proposal is arrogant and disrespectful.   |
| Concerns around foreign investment.   |
| The need for such a development is arguable and hardly justified in the proposal. The rush to capitalise on increased tourism puts at risk the attributes of the city that are valued so highly.  |

|  |
|--|
| May cause traffic and parking problems. Roads and transport networks are not geared towards such overdevelopment.  |
| The proposal's design offers little in the way of street level interaction. Provides nothing for locals.   |
| Taller buildings should be located away from the city centre.  |
| Any attempt to use existing buildings as examples for why a taller building is appropriate presents as a flawed argument. The arguments put forward in the supporting planning report are flawed and without merit.  |
| Out of character, context and out of sync with the area and the City overall and its skyline. It is inappropriate and unsympathetic. High-rise buildings should not be allowed. Threatens the human scale, beauty, integrity and charm of Hobart, which should be preserved. The development would ruin Hobart, which does not need such tall buildings. The best cities in the world do not have high rise buildings.   |
| Development should comply with the height limitations recommended by Leigh Woolley.  |
| Presents the type of building that visitors to Tasmania and Hobart do not want to see. Visitors value the fact that Hobart is not dominated by such developments. The proposal is the complete opposite of what makes the city unique. Such buildings have their place in many other cities throughout the world which have already been ruined by this type of development being allowed. Why kill all that is worthwhile about Hobart all for the sake of becoming just another city that could be anywhere and profiting a few. |
| Amenity impacts upon residential properties close to the subject site – will block sunlight and will overshadow, may exacerbate the effects of wind tunnelling.  |
| Negatively impacts upon and does not complement immediate and wider heritage and landscape values. Hobart is a small scale heritage city.  |
| If the development must include car parking, why not within a basement instead of adding to the overall above ground level height?   |

## 6. Assessment

- 6.1 The *Sullivans Cove Planning Scheme 1997* is a performance based planning scheme. This approach recognises that there are in many cases a number of ways in which a proposal can satisfy desired environmental, social and economic standards. In some cases a proposal will be 'permitted' subject to specific 'deemed to comply' provisions being satisfied. Performance criteria are established to provide a means by which the objectives of the planning scheme

may be satisfactorily met by a proposal. Where a proposal relies on performance criteria, the Council's ability to approve or refuse the proposal relates only to the performance criteria relied on.

- 6.2 The site is located in the Activity Use 1.0 Inner City Residential Area of the *Sullivans Cove Planning Scheme 1997*.
- 6.3 The existing use of the site is limited to 'Carpark' with the existing buildings having been vacated some time ago. The proposed use is a combination of Visitor Accommodation and Function Centre. The existing Car Park use is a discretionary use in the Activity Area. The proposed uses are permitted (Visitor Accommodation) and discretionary (Function Centre) uses in the Activity Area.
- 6.4 The proposal has been assessed against:

6.4.1 Parts A and B – Strategic Framework

The Strategic Framework found in Part B clause 6.2 - Designing the Future Urban Form of the *Sullivans Cove Planning Scheme 1997* includes the following:

*The built and spatial qualities of Sullivans Cove are a product of its unique historic cultural heritage. This must be retained, for once lost, it cannot be recreated.*

*This means more than retaining buildings of historical value. The future urban form of the Cove should respond to the quality of spaces and buildings which exist within the Cove.*

*Future developments within the Cove should respect the scale of the Cove's built form – new buildings should not be out of scale with neighbouring buildings, or the general character of the Cove.*

Of note under the Guiding Principles of Part B clause 7.3.1 are the following statements, of particular relevance to the proposal:

*Cultural Resource Principles: Cultural Heritage -*

- *To facilitate use and development which is compatible with conservation of the Cove's cultural heritage values.*
- *To encourage the recycling of existing buildings through the promotion of new uses, particularly in buildings of identified cultural heritage value.*

- *The recognisable historic character of Sullivans Cove is not to be compromised by new development which overwhelms the historic spaces and buildings, or, by new development which reduces the apparent authenticity of the historic places by mimicking historic forms.*

*Cultural Resource Principles: Urban Character -*

- *Changes to urban character will be consistent with conservation of cultural significance and maritime and historic character of Sullivans Cove.*
- *No new development or part of a development is to be individually prominent particularly when viewed from Sullivans Cove or the River Derwent. Exceptions include cranes and similar development relating to the essential operating requirements of the Tasmanian Ports Corporation.*
- *The distinctive urban form of Sullivans Cove is to be reinforced in development areas.*

*Efficiency Principles -*

- *The promotion of pedestrian and cycle movement, amenity and safety is the primary planning objective for movement within the Cove.*
- *The pavements, carriageways and parks of the Cove shall be improved to increase pedestrian circulation and safety, enhance the pedestrian's experience of the historic character, reduce pedestrian/vehicular conflict, yet maintain vehicular access (including parking and the movement of freight) to serve the diverse activities within the Cove.*
- *The operational requirements for safe and efficient vehicle movement related to the activities of the working port shall be facilitated.*
- *Parking supply within the Cove should be designed and administered to facilitate visitor access, rather than CBD commuters and other long-term parking space users. Long term commuter parking within the Cove should be discouraged.*
- *The visual dominance of car parking throughout the Cove should be reduced, particularly in the Central Cove area.*

*Economic Development Principles -*

- *A mix of retail activities, catering for the needs of tourists, visitors,*

*workers and local residents is encouraged.*

*People in the Cove -*

- *The further development of the residential and visitor accommodation in the Cove is encouraged in locations where the residential amenity will not constrain the economic functionality of the ports and other preferred industrial and commercial uses.*
- *Developments which incorporate convenience facilities, retailing, recreational activity, pedestrian amenity and visual interest will be encouraged at street level.*  
*Activities such as offices, residential accommodation and studios on major pedestrian routes through the Cove should be located at first floor or above.*
- *In its consideration of all applications for use or development the Planning Authority must be satisfied that the use or development:*
  - Reduces opportunities for crime to occur;*
  - Provides safe, well designed and maintains buildings, facilities and public spaces;*
  - minimises the potential for vandalism and anti-social behaviour;*
  - and*
  - Promotes safety on neighbouring public and private land.*

6.4.2 Part D – Clause 15 – Activity Area Controls

The Objectives of the Activity Area at clause 15.2 include:

- *To provide for the development of an inner city residential neighbourhood providing quality urban housing for a range of household types and income groups.*
- *To ensure that residential development is the primary focus throughout the Activity Area but allow non-residential uses to be developed on a flexible performance approach based on the amenity and characteristics of specific sites.*
- *To retain and restore where appropriate buildings of cultural significance.*
- *To ensure that building masses and facades appropriately relate to the spaces they form. Streets within the Zone be considered as spaces in their own right.*
- *To encourage architecture of the highest quality which is modern in approach but at the same time incorporate some interpretation of the history of the area as appropriate.*
- *To ensure that new development incorporate historic cues, whilst*

*not relying on historical mimicry.*

- *To facilitate the transition from the CBD by allowing substantial commercial uses on key sites on the main connecting streets (Campbell and Collins Streets) or in places where reasonable residential amenity is unachievable because of existing traffic or environmental impacts. These commercial uses must not themselves diminish the amenity of or the potential for adjacent residential development.*
- *To encourage frontages of commercial activity only on the ground floor of buildings abutting streets.*
- *To encourage commercial activity in existing buildings where this is required to assist in their conservation.*
- *To encourage a mix of uses on the sites in the west and north-west of the Activity Area and fronting Campbell Street.*

#### 6.4.3 Part E – Schedule 1 – Conservation of Cultural Heritage Values

Part E – Schedule 2 – Urban Form

Part E – Schedule 3 – Public Urban Space

Part E – Schedule 5 – Traffic, Access and Parking

Part E – Schedule 7 – Demolition

Part E – Schedule 8 – Environmental Management

#### 6.5 The proposal relies on the following performance criteria to comply with the applicable standards:

##### 6.5.1. Activity Area Controls (Use) – clause 15.3.4

Conservation of Cultural Heritage Values - Heritage – (Adjacent) – clause 22.5.5

Conservation of Cultural Heritage Values - Archaeology – clause 22.6.5

Urban Form (Building Form) – clause 23.6.2

Urban Form (Building Surfaces) – clause 23.7.2

Public Urban Space (Building or Works) – clause 24.4.6

## Demolition – clause 28.6

- 6.6 Each performance criterion is assessed below.
- 6.7 Activity Area Controls (Use) – clause 15.3.4
- 6.7.1 There is no acceptable solution for a Function Centre use in the Inner City Residential (Wapping) Activity Area.
- 6.7.2 The proposal includes a 1000 seat conference hall with associated meeting spaces.
- 6.7.3 There is no acceptable solution; therefore assessment against the performance criterion (or in this case the Objectives of the Activity Area) is relied on. A use that is deemed to not meet the relevant objectives is deemed to be prohibited.
- 6.7.4 The Objectives of the Inner City Residential (Wapping) Activity Area at clause 15.2 provide as follows:
- *To provide for the development of an inner city residential neighbourhood providing quality urban housing for a range of household types and income groups.*
  - *To ensure that residential development is the primary focus throughout the Activity Area but allow non-residential uses to be developed on a flexible performance approach based on the amenity and characteristics of specific sites.*
  - *To retain and restore where appropriate buildings of cultural significance.*
  - *To ensure that building masses and facades appropriately relate to the spaces they form. Streets within the Zone be considered as spaces in their own right.*
  - *To encourage architecture of the highest quality which is modern in approach but at the same time incorporate some interpretation of the history of the area as appropriate.*
  - *To ensure that new development incorporate historic cues, whilst not relying on historical mimicry.*
  - *To facilitate the transition from the CBD by allowing substantial commercial uses on key sites on the main connecting streets (Campbell and Collins Streets) or in places where reasonable residential amenity is unachievable because of existing traffic or environmental impacts. These commercial uses must not themselves diminish the amenity of or the potential for adjacent*

*residential development.*

- *To encourage frontages of commercial activity only on the ground floor of buildings abutting streets.*
- *To encourage commercial activity in existing buildings where this is required to assist in their conservation.*
- *To encourage a mix of uses on the sites in the west and north-west of the Activity Area and fronting Campbell Street.*

- 6.7.5 While the discretionary component of the proposed use, the 1000 seat conference hall, forms a smaller percentage of the overall proposal, it is housed within the overall building being proposed. Therefore, both the function centre use and the proposed building that houses it must be assessed against the objectives listed above.

As the proposal includes no residential component, it does not further the objectives that relate to the provision of housing. If forming part of a different, future planning application with a built form and operating parameters that were consistent with all relevant provisions of the planning scheme, it is possible that 'function centre' as a use may be considered appropriate in the Activity Area.

As the proposal seeks to demolish all existing buildings on the site, no retention or restoration of buildings is intended, albeit that the existing buildings are not individually listed for cultural significance.

The mass and facade of the proposed building does not appropriately relate to the space that it forms. While at ground level the building provides glazing and some openings, and commercial activities encouraged by one of the objectives, above ground level the podium element of the building rises sharply above the street, albeit with some interest provided in the variable shape of the proposed awning on Collins Street.

The proposed building is clearly modern in its approach, however it is not evident that the design incorporates any relevant interpretation of the history of the area, nor does it appear to incorporate any historic cues. The use of sandstone facing throughout the podium level as a more traditional material is noted.

While the proposal is a substantial commercial use, that use is by no means justified, as the sheer scale of the building it is housed within and its location relative to neighbouring properties would dwarf adjacent residential development, diminishing existing and potential future

residential amenity through unreasonable overshadowing and visual obtrusion. It is considered that reasonable residential amenity for both occupants and neighbours of the subject site could be achieved with an alternative development proposal.

The proposed use does therefore not meet or sufficiently further the Objectives of the Activity Area that are relevant to the subject site. In accordance with the conditions of clause 15.3.4, the use is therefore considered to be prohibited.

6.7.6 The proposal does not comply with the performance criterion (Objectives of the Activity Area).

6.8 Schedule 1 - Conservation of Cultural Heritage Values – Heritage - (Adjacent) – 22.5.5

6.8.1 The acceptable solution at clause 22.5.4 states that 'Building or works' on other land within the planning area is 'permitted' in respect to this Schedule where it can be demonstrated that the following 'deemed to comply' standards can be met:  
For 'building or works' on sites adjacent (as defined in clause 22.3) to a place of cultural significance:

- The height of 'building or works' adjacent to places of cultural significance must not exceed that of any building on the place, at a distance of less than 10 (horizontal) metres from the building; and
- The area of the facade of any new 'building or works' must not exceed that of the facade of an adjacent place of cultural significance by a factor of 2.

6.8.2 The proposal does not satisfy the 'deemed to comply' standards of clause 22.5.4.

6.8.3 The proposal does not comply with the 'deemed to comply' standards; therefore assessment against the performance criterion is relied on.

6.8.4 The performance criterion at clause 22.5.5 provides as follows:

*'Building or works' on land which cannot satisfy the 'deemed to comply' provisions of Clause 22.5.4 may be approved at the discretion of the Planning Authority. The following criteria must be taken into consideration in the assessment of all proposals for 'building or works':*

- *'Building or works' adjacent to a place of cultural significance must not dominate that place when viewed from the street or any other public space, or be more prominent in the street than the adjacent place of cultural significance.*
- *The area of a facade of any new building may be permitted to exceed that of the building on an adjacent place of cultural significance where the Planning Authority is satisfied that the visual impact of the apparent disparity of scale is not significant or that historic precedent warrants the scale disparity.*
- *'Building or works' must complement and contribute to the specific character and appearance of adjacent places of cultural significance and the historic character of the Cove generally.*
- *The location, bulk and appearance of 'building or works' must not adversely affect the heritage values of any adjacent or nearby place of cultural significance.*
- *'Building or works' must not reduce the heritage value of any adjacent places of cultural significance by mimicking historic forms.*

6.8.5 The Council's Senior Cultural Heritage Officer provides the following assessment of the proposal:

*The subject site is adjacent to two places of cultural significance listed within Table 1 of Schedule 1 of the Sullivans Cove Planning Scheme 1997. 'Place' is defined as the site, area, building or work, group of buildings or works with associated contents and surroundings. The only building or works that are 'permitted' adjacent to places of cultural significance must comply with the following standards:*

- *The height of 'building or works' adjacent to places of cultural significance must not exceed that of any building on the place, at a distance of less than 10 (horizontal) metres from the building; and*
- *The area of the façade of any new 'building or works' must not exceed that of the façade of an adjacent place of cultural significance by a factor of 2.*

*The proposal falls well outside the scope of 'permitted' status and must therefore be assessed against the provisions of clause 22.5.5 of the scheme. Among the mandatory tests within that clause are the following:*

- *'Building or works' adjacent to a place of cultural significance must not dominate that place when viewed from the street or any other public*

*space, or be more prominent in the street than the adjacent place of cultural significance.*

- The area of a façade of any new building may be permitted to exceed that of the building on an adjacent place of cultural significance where the Planning Authority is satisfied that the visual impact of the apparent disparity of scale is not significant or that historic precedent warrants the scale disparity.*

- 'Building or works' must complement and contribute to the specific character and appearance of adjacent places of cultural significance and the historic character of the Cove generally.*

- The location, bulk and appearance of 'building or works' must not adversely affect the heritage values of any adjacent or nearby place of cultural significance.*

- 'Building or works' must not reduce the heritage value of any adjacent places of cultural significance by mimicking historic forms.*

*The adjacent listed place in Brooker Avenue is approximately 6 metres high, rising to 8 metres at the apex of the sawtooth roof form. The podium of the proposed hotel is approximately 2.5 times higher than the highest part of the adjacent wall, and the height of the overall building (55.1m) is more than 6 times the height of the adjacent wall. The applicant acknowledges that the proposal will "alter the scale of buildings" within the Cove and will appear as a "landmark within the streetscape".*

*By virtue of the height of the proposed hotel structure, the proposal will clearly dominate adjacent places of cultural significance when viewed from the street and other public spaces, and will be more prominent in the street than the adjacent places of cultural significance.*

*The area of the façade of the proposed new building will radically exceed that of the adjacent places of cultural significance. Any objective assessment would suggest that the visual impact of the apparent disparity of scale is significant. There is no historic precedent to warrant such scale disparity.*

*The proposal fails to complement and contribute to the specific character and appearance of adjacent places of cultural significance in any way – nor to the historic character of the Cove generally. The*

*Resource Management and Planning Tribunal (James Richard Gandy v Hobart City Council & Tasmanian Heritage Council [2016] TASRMPAT 36 (21 November 2016)) has provided the following interpretation in relation to the terms 'complement' and 'contribute':*

*To complement and contribute, requires that the works must confer a state of completeness (or wholeness) upon the building and bring something to the cultural significance, character and appearance of it, within its setting.*

*The Tribunal uses the notion of "completeness" as a concept synonymous with "complement", to convey the idea that the works will make whole or complete the place. ... The idea of doing that work to bring balance back to the overall structure sits with the concept of complementing and contributing to the cultural significance, character and appearance of the place because it restores a part of it.*

*The location, bulk and appearance of the proposed building will adversely affect the heritage values of adjacent and nearby places of cultural significance, by creating an incongruous backdrop fundamentally out of scale with the present visual setting of these structures.*

*The 'permitted' height for the site of 15 metres suggests a much lower building than that proposed, and any building which complied with this height standard would also be likely to avoid being so prominent.*

6.8.6 The proposal does not comply with the performance criterion.

6.9 Schedule 1 - Conservation of Cultural Heritage Values - Archaeology – clause 22.6.5

6.9.1 The acceptable solution at clause 22.6.4 states that works which constitute the excavation of land on any place of cultural significance (as identified in Table 1), including those identified in Table 2, are 'permitted' where a statement is provided by a qualified archaeologist that either the site has been surveyed previously and found not to be of archaeological significance or that the nature of the 'building or works' will not result in destruction of any aspects of items of archaeological significance.

6.9.2 The proposal includes disturbance, including partial excavation of a site listed in Table 2 of Schedule 1 as a Place of Archaeological Sensitivity.

A Statement of Archaeological Potential and an Archaeological Impact Assessment and Method Statement have been submitted with the application, and it has been determined that the proposal is likely to have an impact on significant archaeological remains.

6.9.3 The proposal does not comply with the acceptable solution; therefore assessment against the performance criterion is relied on.

6.9.4 The performance criterion at clause 22.6.5 provides as follows:

*Having regard to the contents and recommendations of an Archaeological Sensitivity Report accepted by the Planning Authority pursuant to Clause 22.6.3 the following criteria must be taken into consideration in the assessment of all proposals to develop places of cultural significance listed in Table 2 or that are considered likely to be of archaeological interest or significance:*

- *The likelihood of the proposed 'building or works' resulting in the removal or destruction of items of archaeological significance.*
- *The cultural significance of the site.*
- *Evidence of an adequate archaeological reconnaissance and site sampling prior to the approval or carrying out of works.*
- *The need to reasonably protect potential archaeological significance during the design, and carrying out of works.*
- *The need to undertake an archaeological 'watching brief' to be required during the carrying out of works.*

6.9.5 The Council's Senior Cultural Heritage Officer provides the following assessment of the proposal:

*The subject site is also a 'Place of Archaeological Sensitivity' and both a Statement of Archaeological Potential and an Archaeological Impact Assessment and Method Statement have been provided. The studies identify zones of high archaeological sensitivity and state that "the proposed development is expected to have impact upon significant archaeological remains in approximately 20 locations across the site. The report suggests that "it is not considered feasible to retain any of these archaeological features in-situ." The proposal will result in a significant loss (about 20%) of archaeological resource across the site.*

*The overall objectives of Schedule 1 – Conservation of Cultural Heritage Values include such statements as:*

- *to ensure that the recognisable historic character of Sullivans Cove is not compromised by new development which overwhelms the places of cultural significance and*
- *to encourage new development to be recognisable as new, but not individually prominent. Such development must reflect a “good neighbour relationship to places of identified cultural value.*

*There are examples of new buildings within Sullivans Cove that adopt a ‘good neighbourly’ approach. Such buildings invariably reflect the predominant scale of the historic port and Wapping area, rather than the scale of more intrusive buildings.*

6.9.6 The proposal does not comply with the performance criterion.

6.10 Urban Form (Building Form) – clause 23.6.2

- 6.10.1 The acceptable solution at clause 23.6.1A requires new buildings to demonstrate that 'deemed to comply' provisions for Height; Alignment (Primary Space); Alignment (Secondary Space); Plot Ratio; Apparent Size and Urban Gardens have been satisfied.

#### Deemed to Comply Provisions

Height - 15m

Alignment (Primary Spaces) - Buildings must be built to the street line of all primary street frontages, with walls located on the front property boundary and extending across no less than 90% of the primary street frontage.

Where a new building is located on a corner with two primary street frontages, this requirement must be satisfied for each frontage.

New buildings must not step back adjacent to a Primary Space. The only permissible exceptions to this is in situations where the stepping back is less than 1:20 relative to the height of the wall on the property boundary and where there is a wall to the boundary at least 12m high.

Alignment (Secondary Spaces) - Where applicable, buildings must also be built to, or align with, the secondary street frontage.

Plot Ratio - 3.0

Apparent Size - The length of buildings in street edge elevation must not

be more than twice the width of the abutting street.

Urban Gardens - Where the construction of a building results in the creation of secondary spaces with public access. These spaces must be fenced at street frontage, landscaped and include facilities for pedestrians as appropriate, such as seating.

6.10.2 The proposal would have a height of 55.1m.

The subject site fronts two primary spaces, however the proposed building is only built to the street line (and partially beyond with regard to the Collins Street awning) for the podium section of the first to fourth floor levels, with the ground level facade set inwards some 4-4.2m from the Collins Street boundary and 3.6m from the Brooker Avenue boundary. The levels above the podium exhibit a much greater setback, particularly from the Collins Street frontage.

There are no secondary spaces adjacent to the site.

The plot ratio of the proposed building is 8.1.

The building occupies the majority of the length of both street frontages, particularly for levels 1 through 4. There is a small discrepancy in the overall width of the ground floor level due to it being set in from the street frontage, with the initial upper levels overhanging. The Highway Reservation of the abutting streets varies in its width, with Brooker Avenue ranging from 30m to 26m, and Collins Street ranging from 51m to 20m. If taking an average between each figure, the proposed building does not exceed twice the width of Brooker Avenue, whilst it exceeds twice the width of the Collins Street reservation by approximately 3.5m. The wide expanse of the Collins Street Highway Reservation where it meets Brooker Avenue benefits the proposal in this regard.

No secondary spaces with public access are created as part of the proposal.

6.10.3 The proposal does not comply with the acceptable solution; therefore assessment against the performance criterion is relied on.

6.10.4 The performance criterion at clause 23.6.2 provides as follows:

*Development which cannot satisfy the 'deemed to comply' provisions' of Clause 23.6.1 may be approved at the discretion of the Planning*

*Authority taking into consideration the Objectives in Clause 23.2. Such development includes:*

- *Any new buildings or works adjacent to a Place of Cultural Significance and which are not more prominent in the streetscape by strong contrast of scale, height, colour and tone with the buildings constructed on the place, and, which are not detailed in a manner which is similar to buildings of cultural significance or which adopts an "historic" appearance.*
- *Works undertaken in accordance with a Conservation Plan approved by the Planning Authority where required and/or provided.*

The Objectives regarding Urban Form at Clause 23.2 state:

*The following objectives apply to the application of this Schedule:*

- *The traditional urban pattern of Sullivans Cove is to be conserved. A contemporary adaptation is to be created in development/redevelopment areas.*
- *Views to Sullivans Cove along primary spaces are to be retained, especially to the River Derwent.*
- *Views over the land bounded by Tasman Highway, Brooker Avenue and Liverpool Street from the City and Wapping to the Domain and from the Domain and Tasman Highway to the City are to be retained.*
- *Expression of the Wall of the Cove is to be encouraged where possible.*
- *The bulk and height of buildings must reflect the natural topography of the Sullivans Cove Planning Area, the amphitheatre sloping down to the Cove and the Macquarie Street and Regatta Point Ridges.*
- *A diversity of building heights and volumes will be encouraged within this over-riding pattern, but buildings must have a respectful relationship to each other and to buildings of identified cultural significance within a street.*
- *New buildings must not be individually prominent in terms of contrast with neighbouring buildings by being significantly higher or having a larger apparent size when viewed in street elevation.*
- *New buildings should facilitate the creation of 'secondary spaces' on lots in the Cove. Such spaces should be encouraged where they demonstrably create useable pedestrian environments and facilitate pedestrian movement and views.*
- *New urban gardens are to be encouraged in secondary spaces*

only.

- *On the land bounded by the Tasman Highway, Brooker Avenue and Liverpool Street the landscaping should reflect the variety of garden areas and parkland styles that exist in the immediate surrounding area and that mark the transition to the Domain.*

6.10.5 Amongst other things, the urban form objectives require the traditional urban pattern of the Cove to be conserved, buildings to have a respectful relationship to each other and to buildings of identified cultural significance, and buildings not being individually prominent in terms of contrast with neighbouring buildings by being significantly higher or having a larger apparent size when viewed in street elevation.

The proposed development is more than 3.5 times the 'deemed to comply' building height, and 2.7 times the 'deemed to comply' plot ratio. For reference, the main roof of the existing, taller part of The Old Woolstore Apartment Hotel has a maximum height of approximately 21m, with the lower sawtooth section being approximately 15m tall. The Hotel Grand Chancellor has a maximum height of approximately 46m. The round building immediately opposite on Collins Street has a maximum height of 23m. The University's 'Hedberg' development currently under construction further to the south-west on the Collins/Campbell Street corner is approved at 33m. Further afield, and subject to a different planning scheme, is the Royal Hobart Hospital being redeveloped to a maximum height of 69m, which includes its helipad.

There are no buildings of similar size or bulk in the immediately adjacent blocks or in this defined entrance way to the Sullivans Cove area to the north-east and east of Campbell Street, and there is relative separation between what are the larger buildings in the immediate area. This is not a situation where the proposed building would fill a gap in a block of taller city buildings, for instance. The incongruous nature of the height, scale and bulk of the proposed new building will be obvious in Collins Street, Brooker Avenue and from a number of other public areas, including the grounds near the Cenotaph.

The over-arching principles of the Sullivans Cove Strategic Framework (within clauses 5, 6 and 7 of the Scheme) also provide general guidance on the nature of new development, responding to the quality of spaces and buildings in the Cove, with future development respecting the scale and general character of the Cove. Clause 7.3.2 reiterates the principle of no new development being individually prominent.

'Prominence' is a concept which features in the provisions of both

Schedule 1 – Conservation of Cultural Heritage Values and Schedule 2 – Urban Form. The Macquarie Dictionary defines 'prominent' as: standing out so as to be easily seen; conspicuous; very noticeable. The Resource Management and Planning Appeal Tribunal (James Richard Gandy v Hobart City Council & Tasmanian Heritage Council [2016] TASRMPAT 36 (21 November 2016)) considered the question of 'prominence' in relation to the corresponding criterion of clause 22.4.5:

*The Tribunal considers that this Criterion does not introduce a subjective element, but rather is a purely objective test. It manifests an intention that new work should be identifiable as such and that it should not be particularly noticeable. Whether it is particularly noticeable is not a question which can be answered by a subjective assessment: the question is not "is that which is installed acceptable". New works which are individually prominent or particularly noticeable are not permitted by the Scheme. This interpretation is consistent with the Tribunal's comments that the threshold for compliance with Criterion 1 with its terms is very high - to the extent that the Scheme intends that there should be little or no new development within the Cove.*

Any objective assessment of the proposal must inevitably lead to the conclusion that the proposed building will be higher, bigger and more prominent in the streetscape and townscape generally than neighbouring buildings. The proposal does not meet the discretionary provisions of clause 23.6.2, as it will be more prominent in the streetscape than adjacent Places of Cultural Significance, by strong contrast of scale, height, colour and tone.

Of note here also are the principles of Schedule 5 - Traffic, Access and Parking of the *Sullivans Cove Planning Scheme 1997*, as they relate to urban form. The proposal includes three levels of car parking, above ground within the podium section of the building on levels two, three and four. Schedule 5 states that car parking provided for facilities in the Cove is likely to be detrimental to the Cove's urban character and heritage. Consequently, in general, car parking will not be required to be provided on-site for any use or development. In the Inner City Residential (Wapping) Activity Area 1.0, Traffic, Access and Parking standards only apply to the area covered by the Wapping Local Area Plan, which does not include and therefore does not apply to the subject site. Schedule 5 clause 26.1 goes on to state that:

*Any development involving the provision of on site car parking will have to demonstrate that the impact of that provision - either physically or*

*operationally will not adversely impact on the character and heritage values of the Cove, on pedestrian movement and amenity.*

Perhaps more critically, under the principles of Schedule 5 at clause 26.2:

*Unless particularly specified as a policy objective or requirement for all or part of an Activity Area, or approved as part of the guidelines for the redevelopment of a Key Site, developments will not be expected to incorporate on-site vehicle parking and it will only be approved to the extent that the car parking does not direct the design of the development and does not have a detrimental effect on the form and character of Sullivans Cove or on its pedestrian amenity and activity. Any development necessitating an exercise of discretion under the Scheme in relation to height to facilitate the provision of on site parking would not be considered to be in keeping with the planning principles for the Cove (emphasis added).*

6.10.6 The proposal does not comply with the performance criterion.

6.11 Urban Form (Building Surfaces) – clause 23.7.2

6.11.1 The acceptable solution at clause 23.7.1 requires development to comply with several 'deemed to comply' provisions, which include:

Building Facade to a Primary Space - Surfaces must be primarily masonry; A maximum allowable void of 50 percent is permissible in all street frontage elevations; Surfaces of facades to primary space must comprise high quality finishes that reinforce the status as a primary building frontage.

Building Facade to a Secondary Space - Surface must be finished so as to be presented in a less detailed and ornate manner than the surface of the building to a primary space, or the surfaces of adjacent buildings to primary spaces.

Night-Lighting - Must accentuate the wall of the building when illuminated, and where appropriate also highlight the landscaping.

Building Surfaces to Brooker Avenue and Tasman Highway in Activity Area 2.0 - Surfaces should contribute to buildings having a minimal visual presence through materials which provide a complex patterning; Surfaces must comprise high quality materials and finishes suitable for viewing as part of the 'gateway' into the Cove.

Surfaces adjacent to nectar bearing native flora (Tasmanian and exotic eucalyptus, etc) - The configuration of buildings and any adjacent nectar bearing native flora must be designed to prevent bird collisions caused by the reflection of such vegetation or sky in glazing and/or unobstructed views through a surface to an outdoor space. Glazing must be consistent with the DPIWE Threatened Species Unit publication "Prevent window collisions: Save our native birds", or achieve comparable performance.

- 6.11.2 The proposal includes a combination of external finishes, including Alucabond or similar spec. cladding; powder coated steel perforated mesh; Alucabond or similar spec. louvers; off form concrete panels; curtain wall glazing; glazing suites. The proposal states that night lighting will be incorporated to accentuate the walls of the building when illuminated, and where appropriate highlight the landscaping. The site is not located in Activity Area 2.0. Whilst there is no evidence provided as to how this will be achieved, the proposal states that The configuration of buildings and any adjacent nectar bearing native flora will be designed to prevent bird collisions caused by the reflection of such vegetation or sky in glazing and/or unobstructed views through a surface to an outdoor space. Glazing must be consistent with the DPIWE Threatened Species Unit publication "Prevent window collisions: Save our native birds", or achieve comparable performance.
- 6.11.3 The proposal does not comply with the acceptable solution; therefore assessment against the performance criterion is relied on.
- 6.11.4 The performance criterion at clause 23.7.2 provides as follows:

*Development which cannot satisfy the 'deemed to comply' provisions of Clause 23.7.1 may be approved at the discretion of the Planning Authority.*

*The objectives of this Schedule must be taken into consideration in the assessment of all 'discretionary' development.*

The Objectives regarding Urban Form at Clause 23.2 state:

*The following objectives apply to the application of this Schedule:*

- *The traditional urban pattern of Sullivans Cove is to be conserved. A contemporary adaptation is to be created in development/redevelopment areas.*

- *Views to Sullivans Cove along primary spaces are to be retained, especially to the River Derwent.*
- *Views over the land bounded by Tasman Highway, Brooker Avenue and Liverpool Street from the City and Wapping to the Domain and from the Domain and Tasman Highway to the City are to be retained.*
- *Expression of the Wall of the Cove is to be encouraged where possible.*
- *The bulk and height of buildings must reflect the natural topography of the Sullivans Cove Planning Area, the amphitheatre sloping down to the Cove and the Macquarie Street and Regatta Point Ridges.*
- *A diversity of building heights and volumes will be encouraged within this over-riding pattern, but buildings must have a respectful relationship to each other and to buildings of identified cultural significance within a street.*
- *New buildings must not be individually prominent in terms of contrast with neighbouring buildings by being significantly higher or having a larger apparent size when viewed in street elevation.*
- *New buildings should facilitate the creation of 'secondary spaces' on lots in the Cove. Such spaces should be encouraged where they demonstrably create useable pedestrian environments and facilitate pedestrian movement and views.*
- *New urban gardens are to be encouraged in secondary spaces only.*
- *On the land bounded by the Tasman Highway, Brooker Avenue and Liverpool Street the landscaping should reflect the variety of garden areas and parkland styles that exist in the immediate surrounding area and that mark the transition to the Domain.*

6.11.5 The proposed building does not meet the 'permitted' provisions of clause 23.7.1, which requires the surface of the building façade to be primarily masonry, with a maximum allowable void of 50 percent. The proposal incorporates Alucobond®, powder coated steel perforated mesh, off form concrete panels, curtain wall glazing, glazing suites and sandstone facing. The proposal must therefore be assessed against the objectives of clause 23.2. As stated previously, these objectives require the traditional urban pattern of the Cove to be conserved, buildings to have a respectful relationship to each other and to buildings of identified cultural significance. The proposed building materials and surface finishes do not have a respectful relationship with established nearby buildings. The majority of the exterior of the proposed tower will comprise curtain wall glass construction, which by any objective assessment is at the other end

of the scale from construction which is 'primarily masonry' as the planning scheme expects.

6.11.6 The proposal does not comply with the performance criterion.

6.12 Public Urban Space (Building or Works) – clause 24.4.6

6.12.1 The acceptable solution at clause 24.4.5 (and clause 24.4.2) requires all minor road works to be carried out in accordance with the Footpath and Road Median Material Types plan shown in Figure 9b of the *Sullivans Cove Planning Scheme 1997*, or any Civic Works & Public Street Furniture Concept Plan incorporated as part of this Scheme, or:

(a) no trees are required to be removed to facilitate the buildings or works;

(b) there is no material alteration to the road or footpath alignment, configuration or profile;

(c) there is no material change to the finished surface materials.

Otherwise such works are discretionary.

6.12.2 The proposal includes an awning partially protruding into the airspace above the Collins Street Highway Reservation, removal and realignment of existing kerbs to alter the current on street car parking arrangement and road width on Collins Street adjacent to the site; removal of an existing street tree to allow for the proposed vehicle entry/exit point to function alterations to the existing footpath width and removal and relocation of existing bollards on Ragged Lane. For the most part, these works are considered to be 'Minor Road Works' classified as

6.12.3 The proposal does not comply with the acceptable solution; therefore assessment against the performance criterion is relied on.

6.12.4 The performance criterion at clause 24.4.6 provides as follows:

*All buildings or works nominated in the table to Clause 24.4.2 as 'D' (Discretionary) require a permit, except where the site is within the area identified by Figure 9a, the building or works are 'permitted'. The Planning Authority may exercise its discretion to approve, approve with conditions, or refuse any application. In considering such applications, the Planning Authority must satisfy itself that the proposed buildings or works are compatible with the following:*

- *The 'Civic Works and Public Street Furniture' Guidelines outlined in*

*Clause 24.4.8.*

- *The function of the Public Urban Space as described in Clause 24.4.10.*
- *The provisions of clause 24.4.9 apply where appropriate.*

- 6.12.5 On a technical basis, the proposed revisions to the pavement, on-street parking and kerb alignment, as well as the removal of the street tree have been accepted in principle by the technical officers tasked with their assessment, who will ensure that such works are carried out appropriately in accordance with Council standards. No public street furniture is proposed and as such the standards governing such things are not relevant to this proposal.

Of note are comments provided by the Council's Open Space and Reserves Officers regarding the proposal removal of the street tree, who state:

*Council's arborist has assessed the tree to be removed and determined an amenity value of \$57,331.15. There would also be a cost for a replacement tree. She also identified that the plans indicate that the awning along the Collins [Street] façade would jut out into the canopy of the trees to be retained along that street, damaging the trees. Could the design be altered to protect the street trees to be retained? And we notice that the street trees are not shown on several of the artist's impressions of the new building. Need to confirm that all the other trees would be retained, undamaged.*

Conditions addressing the payment of the amenity value of the tree to remove it, payment of a replacement cost, preparation of a tree protection plan for the trees to be retained and preparation of an environmental management plan for the removal of the tree have been recommended for any planning permit issued by the Council. Additional technical conditions to manage the alterations to the pavement, kerb and on-street parking areas would also be included on any permit granted for the proposal.

- 6.12.6 The proposal complies with the performance criterion subject to conditions.

6.13 Demolition – clause 28.6

- 6.13.1 There is no acceptable solution for demolition within the Cove under clause 28.3.1. All such demolition is 'discretionary'.

- 6.13.2 The proposal includes demolition of all existing buildings upon the site.
- 6.13.3 There is no acceptable solution; therefore assessment against the performance criterion is relied on.
- 6.13.4 The performance criterion, or in this case 'Guidelines for Development Control' at clause 28.5 provides as follows:

*The demolition of any building, or works on land shall not be 'permitted' unless; a replacement development has been approved, or such demolition is required by statutory order or is authorised by the Building Surveyor as essential to public safety*

*Any application for demolition:*

*(a) Shall be refused if the building is included as a cultural heritage place in Table 1 of the Conservation of Cultural Heritage Values Schedule of this Scheme, unless;*

*(i) The demolition is approved as part of a Conservation Plan approved by the Planning Authority or otherwise in its discretion under the Conservation of Cultural Heritage Values Schedule of this Scheme;*

*(ii) The building clearly detracts from the cultural values or significance of the place; or*

*(iii) There are overriding environmental, economic considerations in terms of the building or practical considerations for its removal, either wholly or in part.*

*(b) May be refused if in the opinion of the Planning Authority the building contributes to the cultural heritage or urban character of the Activity Area and the building is capable of continued beneficial use.*

Additionally, matters to be considered for demolition under clause 28.6 include:

*In considering any proposal for demolition, the Planning Authority shall give regard to the following matters:*

- *The impact of the proposed demolition on the character of the Activity Area;*
- *The impact of the proposed demolition on the cultural heritage values of the Cove;*
- *The need to avoid creation of vacant sites and 'lost space' in the Cove.*

Further, the Objectives of Schedule 7 at clause 28.2 state:

*The protection and promotion of the Cultural Heritage and Urban Character of the Cove is of primary concern in the consideration of proposals to demolish the built fabric of the Cove.*

- 6.13.5 The proposal involves demolition of the Roberts building on the corner of Collins Street and Brooker Avenue. The proposal also involves the demolition of the former Council garage (c.1925) – a building which is still used for vehicle parking, and survives reasonably intact albeit with two external walls removed. The building façade to Collins Street contributes to the urban character of Collins Street and the area generally. The proposal does not meet the provisions of clause 28.5 and clause 28.6 of the Sullivans Cove Planning Scheme 1997, as it involves the demolition of a building which (a) contributes to the urban character of the Activity Area, and (b) is capable of continued beneficial use. The proposed demolition will have a detrimental impact on the character of the Activity Area.
- 6.13.6 The proposal does not comply with the performance criterion.

## **7. Discussion**

- 7.1 Planning approval is sought for Demolition and New Development for Visitor Accommodation, Function Centre and Associated Facilities at 2 Collins Street and adjacent road reserve, Hobart.
- 7.2 The application was advertised and received Fourteen-hundred and Fifty-nine (1459) representations, of which three were in favour. The representations raised concerns including excessive height, inappropriate design, non-compliance with relevant scheme standards, impacts upon surrounding amenity, cultural heritage and the Hobart landscape, the building being out of character with the city and not being compatible with the scale and charm of the place.

- 7.3 The proposal has been assessed against the relevant provisions of the *Sullivans Cove Planning Scheme 1997*, and while it is noted that the height of the building was reduced from what was originally proposed, the revised height of 55.1 metres now proposed is still considered to be significantly beyond the scope and intent of relevant planning scheme standards and objectives. Implications within documentation forming part of the application that these provisions are outdated are not supported. Although the planning scheme clearly had its genesis some years ago, it has been subject to numerous revisions and amendments over its lifespan. It is not a static document, and with regard to provisions around height, there is nothing to suggest that the Scheme is out of step with current community thinking, particularly when it comes to protecting the character of Sullivans Cove. It is suggested that community consultation conducted as part of the City of Hobart's Vision engagement and the City's recently commissioned height reviews support this proposition.
- 7.4 In relation to the proposed use of the building, there is reference within the submitted documentation to the proposed conference facility being reliant upon the number of rooms proposed, and by inference, the scale of the building. While it is accepted that conference facilities require accommodation for delegates to stay in, it is suggested that such accommodation does not necessarily need to be located on-site for a conference facility to be viable. Therefore, while it may be important for the proponent to offer a certain number of rooms to ensure the financial viability of the proposal, and while Hobart may be in need of additional conference facilities, the notion that the number of rooms proposed, and therefore the height and scale of the building, is justified by the proposed conference facility is not supported by the planning scheme.
- 7.5 The *Sullivans Cove Planning Scheme 1997* includes the ability to apply discretion where appropriate, and where the objectives and strategic framework of the scheme can still be achieved. This proposal, however, is considered inconsistent with planning scheme provisions relating to height, plot ratio, heritage, archaeology, demolition, use and parking. The development is more than 3.5 times the acceptable height for the area, and is significantly above the acceptable density. It represents a significantly larger building than those around it. It is unavoidably individually prominent, which is a key scheme consideration. Furthermore, the proposal includes multiple levels of above ground car parking, where the scheme specifically discourages such car parking that exacerbates the height of proposed development. The proposal is inconsistent with the *Sullivans Cove Planning Scheme 1997*, and does not warrant the exercising of discretion sought by the application.

7.6 The proposal has been assessed by other Council officers, including the Council's Development Engineer, Stormwater, Road and Traffic Engineers, Cleansing and Solid Waste Services Officers, Open Space and Recreation Officers, Environmental Health Officers, Surveying Services Officers, Cultural Heritage Officer, and City Design Officers. Some of these officers have raised objection to the proposal, while others have recommended conditions in the event of any approval issued by the Council.

7.7 Given the height of the proposed development, the application was considered by the Council's Urban Design Advisory Panel (UDAP). The Panel met and discussed the proposal with the applicants at the UDAP meeting of 12 September 2018. Although only having an advisory capacity, the Panel formed the following views in relation to the proposal:

*(i) The proposal does not meet the requirements of the Sullivans Cove Planning Scheme 1997, particularly taking into account, the proposed height and form of the development and consideration of the Objectives of Schedules 1 and 2 of the Planning Scheme.*

*(ii) The case as to why the specific attributes of this Proposal (eg overall height and the podium design and its interface with the street) would support the substantial departure in the planning scheme provisions has not been made.*

*(iii) The case has not been made as to why this proposal justifies a fundamental shift in the built scale of the City and the Panel has significant concerns as to the precedent the proposal may have as a result. The proposal and specifically with regard to the proposed height, is not supported by the most recent work undertaken by Urban Design Architect Leigh Woolley which suggests a maximum height of 21 metres in this area. The current deemed to comply height within the Scheme is 15 metres.*

*It is also noted that (extract from the officer report)... 'principles of Schedule 5 highlight that developments will not be expected to incorporate on-site vehicle parking and it will only be approved to the extent that the car parking does not direct the design of the development and does not have a detrimental effect on the form and character of Sullivans Cove.'*

7.8 The proposal is recommended for refusal.

## 8. Conclusion

- 8.1 The proposed Demolition and New Development for Visitor Accommodation, Function Centre and Associated Facilities at 2 Collins Street and Adjacent Road Reserve, HOBART does not satisfy the relevant provisions of the *Sullivans Cove Planning Scheme 1997*, and as such is recommended for refusal.

## 9. Recommendations

That: Pursuant to the *Sullivans Cove Planning Scheme 1997*, the Council refuse the application for Demolition and New Development for Visitor Accommodation, Function Centre and Associated Facilities at 2 Collins Street and Adjacent Road Reserve, HOBART for the following reasons:

- 1 The proposed function centre does not meet the Objectives of Clause 15.2 of the *Sullivans Cove Planning Scheme 1997*, as it:

- a) fails to ensure that the building masses and facades appropriately relate to the spaces they form.

- b) fails to ensure that the proposed non-residential use is based on the amenity and characteristics of specific sites.

- c) fails to ensure that the amenity of or the potential for adjacent residential development will not be diminished.

and is therefore considered to be prohibited under clause 15.3.4 of the *Sullivans Cove Planning Scheme 1997*.

- 2 The proposal does not meet the performance standards of clause 22.5.5 of the *Sullivans Cove Planning Scheme 1997*, as:

- (a) it will dominate adjacent places of cultural significance when viewed from the street or any other public space, and will be more prominent in the street than the adjacent places of cultural significance contrary to the Cultural Resource Principles (Cultural Heritage and Urban Character) of the *Sullivans Cove Planning Scheme 1997* espoused in clause 7.3.2.

- (b) the area of the facade of the new building will exceed that of the buildings on adjacent places of cultural significance and the visual impact of the apparent disparity of scale is significant and historic precedent does not warrant the scale disparity.

- (c) the proposal fails to complement and contribute to the specific character and appearance of adjacent places of cultural significance and the historic character of the Cove generally.

(d) the location, bulk and appearance of the proposed building will adversely affect the heritage values of adjacent and nearby places of cultural significance, by creating an incongruous backdrop out of scale with the present visual setting.

- 3 The proposal exceeds the 'deemed to comply' height, alignment, plot ratio, apparent size and building surfaces standards of clause 23.6.1A and 23.7.1 of the *Sullivans Cove Planning Scheme 1997* and in turn fails to meet the objectives of clause 23.2, in that:
  - a) it fails to conserve the traditional urban pattern of the Cove
  - b) its bulk and height does not reflect the natural topography of the Sullivans Cove Planning Area, the amphitheatre sloping down to the Cove and the Macquarie Street and Regatta Point Ridges.
  - b) it does not promote a respectful relationship between buildings and to buildings of identified cultural significance within a street.
  - c) the building will be individually prominent in terms of contrast with neighbouring buildings by being significantly higher or having a larger apparent size when viewed in street elevation.
  - d) the building does not facilitate the creation of 'secondary spaces' on lots in the Cove.
- 4 The proposal exceeds the maximum 'permitted' height standards and exceeds the standards for apparent size of clause 23.6.1A of the *Sullivans Cove Planning Scheme 1997* and does not meet the corresponding discretionary provisions of clause 23.6.2, as it will be more prominent in the streetscape than adjacent Places of Cultural Significance, by strong contrast of scale, height, colour and tone.
- 5 The proposal does not meet the provisions of clause 28.5 and clause 28.6 of the *Sullivans Cove Planning Scheme 1997*, as it involves the demolition of a building which (a) contributes to the urban character of the Activity Area, and (b) is capable of continued beneficial use. The proposed demolition will have a detrimental impact on the character of the Activity Area.

| <p>Pursuant to the <i>Water and Sewerage Industry Act 2008</i> (TAS) Section 56P(1) TasWater imposes the following conditions on the permit for this application:</p> <p><b>CONNECTIONS, METERING &amp; BACKFLOW</b></p> <ol style="list-style-type: none"> <li>1. A suitably sized water property connection(s) must be provided to service the domestic and fire demands of the proposed development in accordance with TasWater standards and any other conditions in this permit.<br/><br/><i><b>Advice:</b> TasWater modelling indicates that the requested flows can be supplied at the required pressures in the DN200 main at the proposed connection point and does not take into account losses through the connection or through internal pipework. Flows will need to be controlled so as not to exceed the maximum figures requested in the application.</i><br/><br/><i>It should also be noted TasWater will not accept direct fire boosting from the network unless it can be demonstrated that the periodic testing of the system will not have a significant negative effect on our network and the minimum service requirements of other customers serviced by the network. To this end break tanks may be required with the rate of flow into the break tank controlled so that peak flows to fill the tank do not also cause negative effect on the network.</i></li> <li>2. A suitably sized sewer property connection must be provided to service the sewerage demands of the proposed development and must discharge directly into a TasWater sewer manhole in accordance with TasWater standards and any other conditions in this permit.<br/><br/><i><b>Advice:</b> The local sewer reticulation system can surcharge to surface in wet weather and the developer should ensure that internal plumbing is designed to avoid problems from backflow of sewage from the reticulation system overflowing into their basement or ground floor.</i></li> <li>3. Any removal/supply and installation of water meters and/or the removal of redundant and/or installation of new and modified property service connections must be carried out by TasWater at the developer's cost.</li> </ol> |                            |                     |               |

**BOUNDARY TRAP AREA**

4. The proposed development is within a boundary trap area and the developer must provide a boundary trap that prevents noxious gases or persistent odours back venting into the property's sanitary drain. The boundary trap must be contained within the property boundaries and the property owner remains responsible for the ownership, operation and maintenance of the boundary trap.

**TRADE WASTE**

5. Prior to the commencement of operation the developer/property owner must obtain Consent to discharge Trade Waste from TasWater.
6. The developer must install appropriately sized and suitable pre-treatment devices prior to gaining Consent to discharge.
7. The Developer/property owner must comply with all TasWater conditions prescribed in the Trade Waste Consent.

**DEVELOPMENT ASSESSMENT FEES**

8. The applicant or landowner as the case may be, must pay a development assessment fee to TasWater, as approved by the Economic Regulator and the fees will be indexed, until the date they are paid to TasWater, as follows:

- a. \$1,114.71 for development assessment;

The payment is required within 30 days of the issue of an invoice by TasWater.

**Advice****General**

For information on TasWater development standards, please visit

<http://www.taswater.com.au/Development/Development-Standards>

For application forms please visit <http://www.taswater.com.au/Development/Forms>

The developer is responsible for arranging to locate existing TasWater infrastructure and clearly showing it on any drawings. Existing TasWater infrastructure may be located by TasWater (call 136 992) on site at the developer's cost, alternatively a surveyor and/or a private contractor may be engaged at the developers cost to locate the infrastructure.

**TRADE WASTE**

Prior to any Building and/or Plumbing work being undertaken, the applicant will need to make an application to TasWater for a Certificate for Certifiable Work (Building and/or Plumbing). The Certificate for Certifiable Work (Building and/or Plumbing) must accompany all documentation submitted to Council. Documentation must include a floor and site plan with:

1. Location of all pre-treatment devices i.e. grease arrestor;
2. Schematic drawings and specification (including the size and type) of any proposed pre-treatment device and drainage design; and
3. Location of an accessible sampling point in accordance with the TasWater Trade Waste Flow Meter and Sampling Specifications for sampling discharge.
4. Details of the proposed use of the premises, including the types of food that will be prepared and

served; and

5. The estimated number of patrons and/or meals on a daily basis.

At the time of submitting the Certificate for Certifiable Work (Building and/or Plumbing) a Trade Waste Application form is also required.

If the nature of the business changes or the business is sold, TasWater is required to be informed in order to review the pre-treatment assessment.

The application forms are available at <http://www.taswater.com.au/Customers/Liquid-Trade-waste/Commercial>.

EB:SJB  
F18/33665

17 April 2018

**MEMORANDUM: GENERAL MANAGER****REQUEST TO GRANT LAND OWNER CONSENT TO  
LODGE A PLANNING APPLICATION**

Site Address: **2 Collins Street, Hobart**

Description of Proposal: **Removal of existing street tree in Collins Street Highway Reservation**  
**Relocation of bollards in Ragged Lane Highway Reservation**  
**Relocation of kerb line in Collins Street Highway Reservation**  
**Awning over footpath in Collins Street Highway Reservation**  
**Changes to parking in Collins Street Highway Reservation**  
**Removal and replacement of two street lights in Collins Street Highway Reservation**

Applicant Name: **Jonathan Buist - S Group**

PLN (if applicable): **PLN-16-1133**

Land owner consent for the proposed development was granted on 23 May 2017. However, due to the new design of the building including reduction in height it has been advised by the Manager Development Appraisal and Manager Development Compliance that given that the application has substantially changed the previous land owner consent does not apply to the amended plans.

The proposal for works within the Highway Reservation have not changed substantially apart from the removal of louvres on the building over the Highway Reservation.

**MISSION ~ TO ENSURE GOOD GOVERNANCE OF OUR CAPITAL CITY.**

The proposed development within the Collins Street and Ragged Lane Highway Reservations in which landlord consent is recommended and shown on the attached plan are:

1. Removal of existing street tree in Collins Street Highway Reservation

The Manager Parks and Recreation has previously advised that the removal of the tree outside the proposed driveway is supported. The Director Parks and City Amenity has previously verbally advised that a replacement tree would be required and consideration given to seeking compensation. It has been noted on the plan that approval is required before the tree is removed and consideration given to a replacement tree and/or compensation.

2. Relocation of bollards in Ragged Lane Highway Reservation

The relocation of the bollards in Ragged Lane to cater for the changes in kerb line is supported. The final position will be determined in accordance with City of Hobart requirements.

3. Relocation of kerb line in Collins Street Highway Reservation

The relocation of the kerb and associated infrastructure is supported in-principle. The final design will need to be submitted for approval by the Director City Infrastructure. The provision of a minimum footpath width of 2 metres is to be achieved within the Highway Reservation at the proposed vehicle entrance and is noted on the plans.

4. Awning over footpath in Collins Street Highway Reservation

The proposed awning, being 6 metres above the Highway Reservation is supported and will be conditioned for accordingly within the planning permit.

5. Changes to parking in Collins Street Highway Reservation

The changes to parking being two parking drop off spaces and bus layby, were previously supported by the Manager Traffic Engineering.

6. Removal and replacement of two street lights in Collins Street Highway Reservation

The removal of two street lights currently mounted on the existing building and their replacement is supported in-principle. The new lights will need to be installed in accordance with City of Hobart requirements.

The development is supported in principle by the Manager Road and Environmental Engineering for the planning application to be lodged.

#### **RECOMMENDATION**

**That pursuant to Section 52 of the Land Use Planning and Approvals Act 1993, the General Manager grant consent on behalf of the Hobart City Council as the owner/administrator of the above land to allow the applicant to make application to the City for a planning permit for the development described above and as per the attached documents.**

## LAND OWNER CONSENT TO LODGE A PLANNING APPLICATION

Site Address: **2 Collins Street, Hobart**

Description of Proposal: **Removal of existing street tree in Collins Street Highway Reservation**  
**Relocation of bollards in Ragged Lane Highway Reservation**  
**Relocation of kerb line in Collins Street Highway Reservation**  
**Awning over footpath in Collins Street Highway Reservation**  
**Changes to parking in Collins Street Highway Reservation**  
**Removal and replacement of two street lights in Collins Street Highway Reservation**

Applicant Name: **Jonathan Buist - S Group**

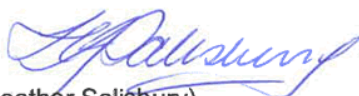

PLN (if applicable): **PLN-16-1133**

The land indicated above is owned or is administered by the Hobart City Council.

The applicant proposes to lodge an application for a permit, pursuant to the *Land Use Planning and Approvals Act 1993*, in respect to the proposal described above.

Part or all of the application proposes use and/or development on land owned or administered by the City located at Collins Street and Ragged Lane Highway Reservation (as shown on the attached plans).

Being and as General Manager of the Hobart City Council, I provide written permission to the making of the application pursuant to Section 52(1B)(b) of the *Land Use Planning and Approvals Act 1993*.

  
(Heather Salisbury)  
**ACTING GENERAL MANAGER**

PLN *(if applicable)*:         **PLN-16-1133**

Pursuant to Section 52(1B)(b) of the *Land Use Planning and Approvals Act 1993*, the General Manager may provide written permission to allow the submission of a planning application involving Council-owned/administered land.

Following a request from the above applicant, I have provided consent for the lodgement of a planning application.

The applicant has been advised that the granting of the consent is only for the making of the application and in no way should the consent be seen as prejudicing any decision the Council is required to make as the statutory planning authority or as the owner/administrator of the land.

As the planning application proceeds through the statutory process, statutory public advertising may be required.

(Heather Salisbury)  
**ACTING GENERAL MANAGER**

11<sup>th</sup> April 2018

Hobart City Council  
Elizabeth Street, Hobart

Re: 2-6 Collins Street - Request for landlord consent for work on and over the Collins Street / Brooker Ave / Ragged Lane road reserves, Hobart.

Ref. document S Group - Site Plan A02 DA-V2 09/04/2018 REV B

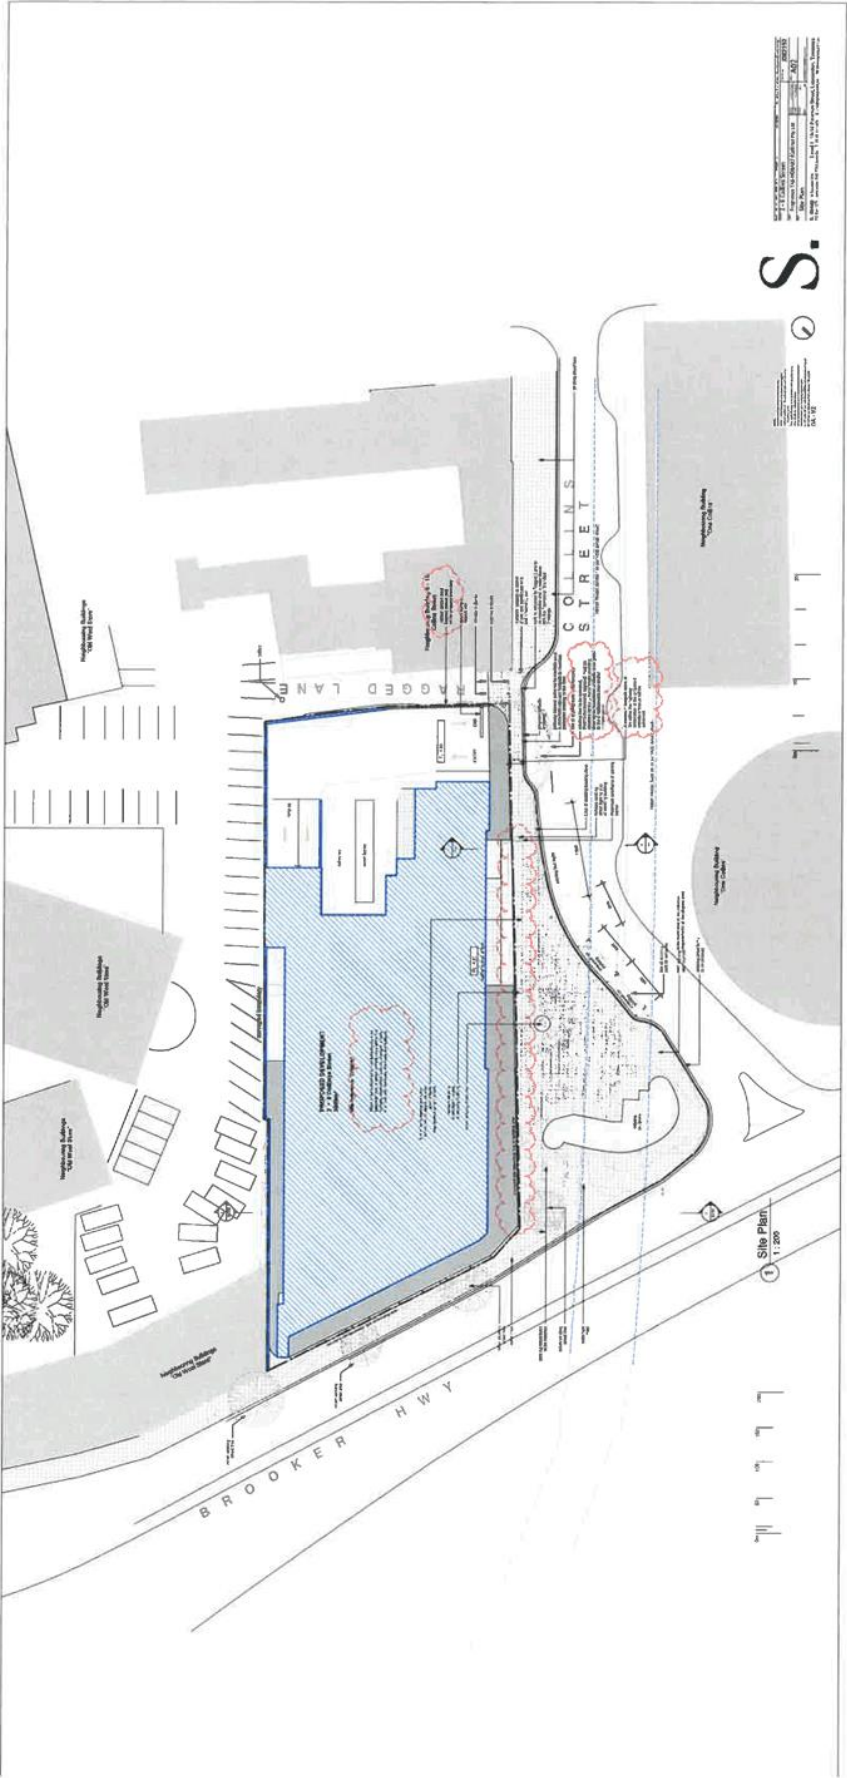

The following items are raised for landlord consent;

1. Removal of existing street tree to provide safe vehicle access into on site parking with-in the hotel complex
2. Relocation of existing bollards South along Ragged lane on advice of HCC
3. Adjust existing line of kerb for new cross over into proposed hotel driveway
4. Protrusion of proposed entry awning over road reserve (min. clearance of 6.0 mtrs, max. protrusion of 1.6mtrs)  
This will provide visitor shelter between title boundary and drop off / parking point in Collins Street.
5. Extension of existing loading zone by 2 carspaces, towards Brooker Ave. This will provide opportunity safe disembarking from vehicles
6. Installation of 2 new street lamps into the road reserve to replace existing street lights on 2-6 Collins St. This would be undertaken at the developers cost.

Yours Sincerely,

Jonathan Buist, Project Architect

*Chase. Wonder.*

# Executive Summary

The proposal is to offer a 4-star hotel facility, complemented by a large conference facility and associated commercial operations.

- 256 room hotel with a combination of suites, 2 bed and 3 bed rooms
- hotel lobby, restaurant, café, commercial space and associated facilities
- 1000 seat conference room with associated breakout spaces and catering
- 167 car spaces and full size coach parking
- wellness centre and spa, swimming pool, gym and club house

Nominal Construction Budget

\$55M

Program Pending Approvals

Late 2018 Construction Commencement

## Key Benefits

### Conference Facility

The proposal includes a 1000 seat conference room with associated facilities. It is noted that the critical mass of the hotel is directly related to the conference facility, allowing Hobart to host large national and international conferences as a destination.

### 256 Hotel Rooms

Recent studies have shown Hobart is in clear need of hotel rooms. The scale of this proposal provides a large indentation in the demand.

### Activation - lower Collins St

Inclusion of conference facilities and hotel will bring activation to the lower end of Collins St with significant numbers of staying guests and the hosting of major events. A hotel restaurant, separately tenanted cafe and retail shop will lead to increased pedestrian traffic and further activation.

## Site

Located at the northern end of Collins Street, 2-6 Collins Street offers the city a unique opportunity – not only to activate the somewhat quiescent precinct, but to offer a stepping stone and potential gateway to the future development at Macquarie Point.

In recent years, the site has been home to Roberts, and currently is used as storage and car parking. It is proposed that all existing development on the site is to be demolished in readiness for the proposed works.

## Architect

A unique multi-disciplinary studio integrating architecture and strategic creative design. S. Group are leaders in offering a combination of specialist knowledge, resources, capability and scale, driven by an ultimate vision to enhance our communities both on a local and global scale through interactions with progressive, functional, and beautifully considered design. Listed on the BRW top 100 new companies alongside winning a number of other accolades in recent years, the team are truly thrilled to work collaboratively with the developer, council and community to achieve a respectful, sustainable and progressive outcome for the city.

## Developer

Fragrance Group is an established developer having successfully completed more than 100 developments comprising hotel, residential and commercial / industrial buildings in Singapore. The Group has been active in Australia since 2014 and has major developments in Melbourne and Perth, as well as Hobart. Respectful to the physical and economic cityscape of Hobart, Fragrance Group are excited to work alongside the council and community to achieve a positive lasting impact.

| Flood Risk Assessment         | Entura Hydro Tasmania       |
| Environmental Site Assessment | Geo-Environmental Solutions |

## Design Philosophy

The proposed architecture has been highly philosophically considered, taking cues from not only the directly adjacent history, but also that of the city of Hobart itself.

The proposed development challenges a number of points in the planning scheme. However, we believe the proposal to be highly contemplated, not only in form, but in the story the architecture tells from its place, and the level of complementary community benefits apparent.

The form of the building takes cues from the surrounding landscape context with each opposing façade relating to its context as shown on the diagrams.

## Economic Benefit

It is clear that the proposal offers significant economic benefit to both the Hobart and Tasmanian economies. It is noted that the developer has a number of other projects of similar scales in Hobart, which will provide a substantial positive impact for the local economy.

## Sustainability

The project's focus on sustainability is not only on an environmental level, but also incorporating social and cultural sustainability on a number of platforms. The architecture of the project will look to incorporate energy efficient lighting and equipment, along with consideration of materials embodied energy, ensuring both initial and ongoing environmental benefits.

Additionally, social and cultural sustainability are key drivers by offering the potential for the site to be a strategic linkage point. It will connect to the city via Collins Street, to Macquarie Point.

## Project Scale

The scale of the project is co-dependent on a number of key development components. The scale of the conference facility, which allows the project to become a national conference destination, relies on the number of hotel rooms. This quantity of hotel rooms is also necessary to attract large premium international hotel operators to enter the Hobart market. The size of the hotel also supports substantial commercial operation on the ground floor, encouraging permeability and activation of the end of Collins Street. Further the quantity of hotel rooms, being 4 star and diverse in size (studio, 2/3 bedroom) ensure a broad demographic of users, and maintain viability for facilities, such as a full floor wellness centre.

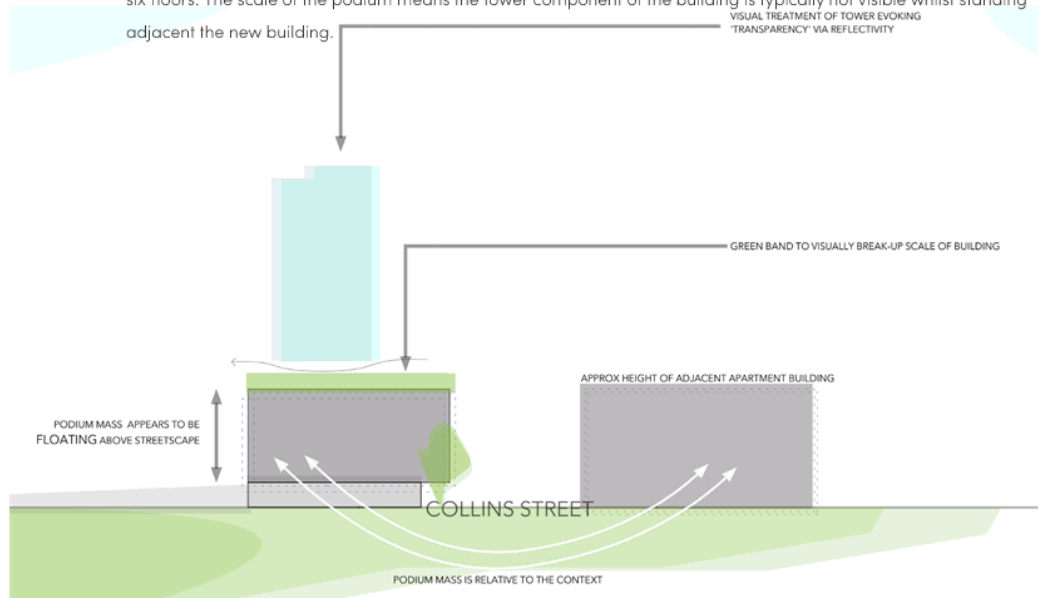

## Conference & Coaches

The proposed 1000 seat conference facility is a unique offering for Hobart and could see the city become a national destination further adding significant economic benefit. Through consultation of Tasmanian coach operators, it is evident that there is a lack of quality accommodation with suitable parking. The proposal includes full size coach parking on site, allowing the hotel to be accessible to large tour groups.

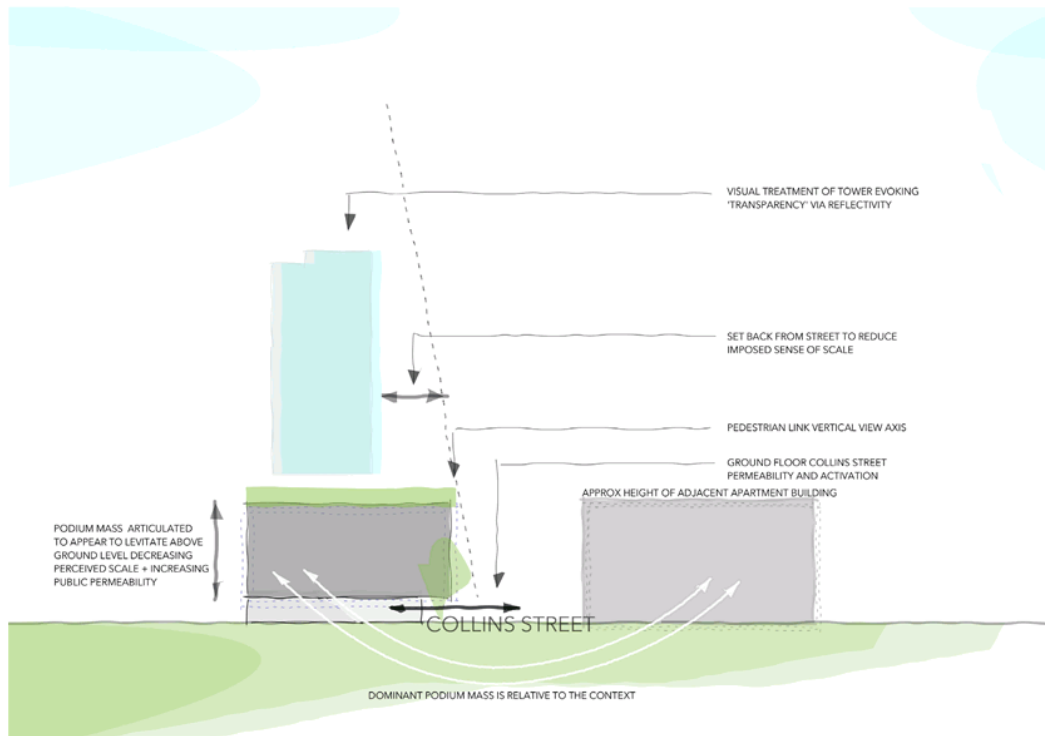

## Built Form & Context

The building is comprised of two components, the first being the podium of five stories being a nominal 20 metres in height and includes capacity for 167 car spaces and a 1000 seat auditorium. The second component, the tower, takes the building to a total of 15 floors and a nominal 51.6 metres of height. Note: this excludes rooftop plant and overrunning structure.

The proposal is broken down into two components, ensuring the buildings mass and façade relate to the adjacent spaces/street. The podium being five floors in height is proportional to the adjacent apartment building consisting of six floors. The scale of the podium means the tower component of the building is typically not visible whilst standing adjacent the new building.

The two components of the development (podium and tower) assist in minimising the apparent scale of the build. The proposed façade has been articulated in such a fashion as to break down the inherent horizontal scale through the use form, cladding, materiality and tone. The podium is elevated at street level to maximise connection between the interior and exterior. This also gives the perception that the podium is lighter in structure, reducing the bulk heaviness that would otherwise be perceived from a building form that brings solid perimeter walls right down to ground level.

# Urban Activation

The ground floor of the proposed development allows legible and permeable commercial use, being a hotel lobby, food premises and further commercial spaces available for approved use. This, in association with the potential for a pedestrian and bicycle link to Macquarie Point, encourage activation of Collins Street site as a key link.

## 1. Introduction

This is a report to support a development application to demolish a current office/storage type building and replace it with a hotel and conference centre facility.

Figure 1 - Current development on site

Figure 2 - Location Plan - Site - source theLIST

The former Robert's building has little in the way of architectural merit and adds little to the streetscape. The car park (which is a recent addition to the site) services mainly long term parkers – the hospital, UTAS and office blocks in the CBD.

## 2. About the Development

### 2.1 Proposal

The proposed development is described as:

- Ground Level – Hotel lobby, restaurant/cafe (for hotel), small retail shop, coach parking/delivery and ancillary administration spaces, taxi pick up and drop off areas
- First Floor Level – conference facilities and ramp to car parking
- Second to Fourth Floor – car parking – 167 spaces
- Fifth Floor – open podium level
- Sixth Floor – pool, wellness centre and operational areas for hotel
- Seventh to fourteenth first floors – hotel rooms – a total of 256 rooms
- The total height is the building is 51.6m (56.2AHD) with a further 3.5m of plant / equipment and architectural features on the roof.

### 2.2 Architectural Statement

The proposed architecture has been highly and philosophically considered taking cues from not only the directly adjacent developments and their history, but also that of the city of Hobart itself with its reference to the significance of the landscape as well as the built environment.

Whereas the proposed development challenges a number of points in the scheme we believe the proposal to be measured not only in form but in the story the architecture tells from its place and the high level of complementary community benefits apparent.

The form of the building takes cues from its city context with each opposing façade relating to its context as shown on the diagrams.

The proposal includes a 1000 seat conference facility with associated facilities. It is noted the critical mass of the hotel is directly related to the conference facility allowing Hobart to host large national conferences as a destination.

Recent studies have shown Hobart is in clear need of volume of hotel rooms. The scale of this proposal provides a large indentation in the demand.

## 3. Site and Title

The property is known as 2 - 6 Collins Street, Hobart.

Legally the site is known as:

|                         |                                  |
|-------------------------|----------------------------------|
| <b>Property Address</b> | 2 – 6 Collins St HOBART TAS 7000 |
| <b>Property ID</b>      | 5660219                          |
| <b>Title Reference</b>  | 121603/1                         |

The site is graphically depicted below:

Figure 3 - Location plan - site - source theLIST

#### 4. Use of Site

The subject site is currently occupied by a vacant double storey building which over its life has been incarnated as an office, used for administration, a warehouse and most recently for rural supply sales (agri-business). Two structures currently occupy the site at 2-6 Collins Street, Hobart – the above mentioned double storey brick office space and Half of the subject land parcel functions predominantly as an open air single level commercial car park (long and short term).

#### 5. Surrounding Uses

2-6 Collins Street sits within an area on the edge of the Hobart CBD where regeneration of historical sites within the Sullivan's Cove precinct is occurring. Hobart continues to grow and mature as Tasmania's capital city, and accordingly the attraction of investors is effectively altering how the built environment is being used. The current mix of uses within the Wapping area and on the edge of the CBD within the Sullivan's Cove area includes commercial, residential and government/community services with infill developments slowly and sensitively revitalising the precinct.

The site abuts the Brooker Highway with the "ABC" precinct to the north. Neighbouring the site to the west is the 'One Collins' residential apartment building. To the east is the 'Old Woolstore' apartment hotel, with a residential complex grouped under the name Wapping abutting Ragged Lane to the south.

The surrounding built form is typified by low density, office and residential buildings with short stay apartment buildings, and hotels punctuating much of the Wapping Activity Area in the immediate vicinity of the subject site between the Brooker Highway and Campbell Street. Larger in scale – ranging in height from 15m to 27m the Royal Hobart Hospital's 'K-Block' will have a height of approximately 46m;(when topped out by the helipad)- The proposed building will have a height of 51.6m – comparable to the Commonwealth Government Centre at 188 Collins Street, (52m).

Figure 4 - Site in context

Figure 5 - Site in context

Figure 6 - Site in context

## 6. Sullivan's Cove Planning Scheme 1997 (the Planning Scheme)

The subject site sits within the 'Wapping Corner' – an area on the edge of the Hobart CBD vaunted for its origins as part of Hobart's early settlement. With very few remnants of its heritage either still in existence or intact, the area has been earmarked for redevelopment, originally by the Commonwealth Government funded 'Better Cities Program' in the early 1990's – and within the provisions of the Sullivan's Cove Planning Scheme 1997 (the Planning Scheme).

### 6.1 Definitions and Use Status

The Planning Scheme has a range of definitions by which to classify uses. In this instance the following definitions best align with the objectives of the proposal:

**Visitor Accommodation** Means the use of buildings and spaces for short term occupancy by people who are visitors to the Planning Area, including Residential Hotel, Holiday Unit and Motel.

**Function Centre** Land used, by arrangement, to cater for private functions, and in which food and drink may be served, such as a conference centre or reception centre. It may include entertainment and dancing.

Other uses (restaurant and shop) are ancillary to the main use of hotel.

Within the zone Visitor Accommodation is a Permitted use and Function Centre is a Discretionary Use.

### 6.2 Zoning/Activity Area

The site is zoned Inner City Residential (Wapping) in terms of the Planning Scheme. The site is within the Wapping Local Area Plan (LAP) as shown in the figure below:

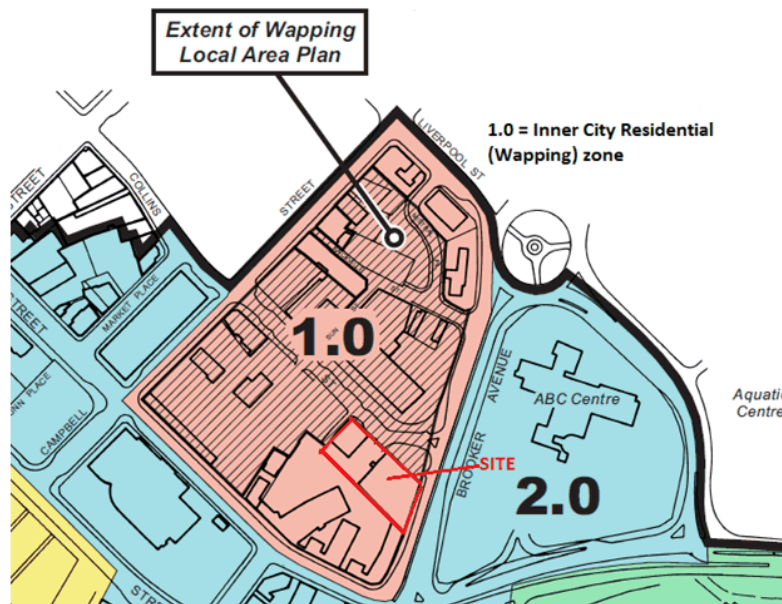

Figure 7 - Wapping Activity Area - Sullivan's Cove Planning Scheme

### 6.3 General Characteristics of the Activity Area

The Wapping Activity Area has been earmarked for significant redevelopment for residential purposes in the early 1990s as part of the Commonwealth Government's Better Cities Program.

Once a residential and industrial area of small cottages and various industries, and more recently used as a bus depot, Wapping has remained under-utilised for a number of years. Little survives that is recognisably 'historic'. Exceptions to this include St David's Church, Theatre Royal Hotel, Theatre Royal and the Woolstore tourist apartments (formerly known as the Roberts building) which have recently been recycled as tourist apartments.

An Outline Development Plan and Local Area Plan were prepared for the major part of the Activity Area focussing on facilitating residential development behind and above a commercial frontage to Collins Street. Although a number of new residential developments have taken place since the Scheme's inception, significant key sites remain undeveloped.

Areas to the north and west of the main Wapping area are used for a range of activities. These are areas where residential amenity is not high because of noise, privacy and overshadowing issues, and some non-residential uses which are compatible with inner city residential development should be encouraged to locate here. Similarly, some of the sites abutting the city CBD along Campbell Street might also be suitable for non-residential development where they capitalise on possible synergies with neighbouring land uses such as the hospital, or Theatre Royal or where they complement commercial activity along Collins Street.

It is important to achieve the commercial viability of new uses in Collins Street that there is a transition from the city CBD commercial character rather than clear separation of it from Wapping. This transition needs to be expressed in both the urban form and massing of buildings as well as the type and location of uses.

The Local Area Plan is incorporated into this Scheme and will form the basis for use and development control over a large section of this Activity Area.

*Areas to the north and west of the main Wapping residential development are used for a range of activities. In addition to promoting residential use of these sites, a range of non-residential uses, which are generally compatible with inner city residential development, will be encouraged.*

*Use and development controls for the Activity Area are outlined within this Scheme.*

This particular site is not within the Wapping LAP. The site and uses relate well to the commercial type uses which will be “encouraged” in the Activity Area. The Planning Scheme recognises that this area of Hobart is in transition from industrial uses to uses reflecting the contemporary changing character of Hobart as a regenerating Capital city. Due to the proximity of the Wapping Area to the Brooker Highway, and its position at the entrance to the Hobart CBD, it has been recognised residential uses are not appropriate due to noise, privacy and overshadowing issues.

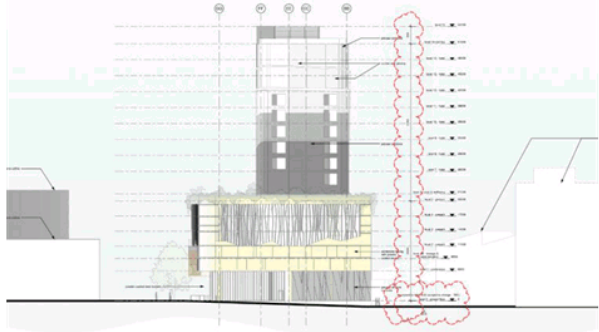

The Planning Scheme also recognises the importance of achieving commercial viability of new, non-residential uses in Collins Street specifically. With very few infill opportunities available in the Hobart CBD coupled with the increasing cost of land, it is increasing difficult to justify low density developments limited to 4 or 5 levels in order to meet a notional planning need. With very few shops, services or activation within this strategically important area, the option of allowing sprawl at the expense of Hobart consuming more land in a geographically constrained state is simply untenable. Car dependency is gradually reducing the amenity of a city with a public transport system yet to be able to cope with and meet the demands of a growing population – unless plot ratios in the Hobart CBD are revisited, revised and allow for optimal though sensitive utilisation of urban space, Hobart will be on track to become a casualty of its very own success

The proposal, in principle, aligns with the character of the Activity Area.

#### 6.4 Objectives of the Activity Area

| Objectives   | Comments  |
|--|---|
| To provide for the development of an inner city residential neighbourhood providing quality urban housing for a range of household types and income groups.  | <p>There is a recognition within the General Characteristics of the Activity Area that there are areas <i>where residential amenity is not high because of noise, privacy and overshadowing issues.</i></p> <p>This would be one of those areas. An exposed frontage to a main highway is not conducive to a residential use. Visitor Accommodation can be considered in such locations as the cost of measures needed to negate noise can be spread across a use providing a high return on investment. Just because the proposal does not provide for residential uses does not mean the development is contrary to this objective.</p>   |
| To ensure that residential development is the primary focus throughout the Activity Area but allow non-residential uses to be developed on a flexible performance approach based on the amenity and characteristics of specific sites. | <p>The Planning Scheme recognises that there are certain parts of the Activity Area which are not suitable for residential use due to <i>noise, privacy and overshadowing issues.</i></p> <p>There are a number of hotels/visitor apartment developments in close proximity to this site. There are also a number of current uses like the Royal Hobart Hospital and a campus of UTAS which would benefit from having a hotel in close proximity (for visitors to those facilities). The proposed development is close to the Macquarie Point area which is the subject of an urban renewal proposal – the activation of this area of the city from heavy industry to education/entertainment activities.</p> <p>A hotel in this location will complement the new direction</p> |

| Objectives  | Comments  |
|---|---|
|   | <p>for Macquarie Point.</p> <p>A major conference facility on this site will also bring life and activity to this end of Collins St and spill over into the Macquarie Point development.</p>  |
| To retain and restore where appropriate buildings of cultural significance.   | The current building is not identified as having any cultural significance.   |
| To ensure that building masses and facades appropriately relate to the spaces they form. Streets within the Zone be considered as spaces in their own right.  | <p>The proposal can be broken down into two components which ensures the building's mass and façade relate to the adjacent spaces/street. The podium, being 5 storeys in height, is proportional to the adjacent apartment building consisting of 6 storeys. The scale of the podium means the tower component of the building is typically not visible whilst standing adjacent the new building within Collins St.</p>   |
| To encourage architecture of the highest quality which is modern in approach but at the same time incorporate some interpretation of the history of the area as appropriate.  | S Group have philosophically considered the context of location, its history and have accordingly imbued the design with references to Hobart's architectural heritage, but also the natural environment surrounding the city of Hobart itself (refer Architectural Description).   |
| To ensure that new development incorporate historic cues, whilst not relying on historical mimicry.   | The proposed is not an example of architectural appropriation nor does it seek to engage in architectural facadism. The building envelope is a sensitive response to the history of the Wapping district, to the heritage and prevalent architectural styles of Sullivan's Cove and to a greater degree, the natural landscape of Mount Wellington through the materiality of the design. The proposal does not attempt mimicry in any sense of the word.   |
| To facilitate the transition from the CBD by allowing substantial commercial uses on key sites on the main connecting streets (Campbell and Collins Streets) or in places where reasonable residential amenity is unachievable because of existing traffic or environmental impacts. These commercial uses must not themselves diminish the amenity of or the potential for adjacent residential development. | <p>The commercial use fronting Collins Street is significant however through considered and responsive design, sensitive treatments – inclusive of a double height ground floor with recessed entrance, encourages a positive interplay with the street by providing shelter and separate entrances for co-located building functions/uses activating the Wapping area; in this regard it complies fully with the intent of this clause. Due to proximity and exposure to a major traffic route residential development in this site is not appropriate. The proposal will not diminish the amenity of current residential uses in the precinct.</p> <p>As all adjoining sites are fully developed there will be no loss of development potential brought about by this</p> |

| Objectives  | Comments  |
|---|---|
|   | <p>development.</p> <p>The impact of overshadowing is illustrated below – presenting existing shadowing and likely shadowing over the Wapping residential developments.</p>  <p>Full shadow diagrams are shown in the large-scale plans attached to this application.</p> |
| To encourage frontages of commercial activity only on the ground floor of buildings abutting streets.                 | The proposal presents a ground floor of commercial activity. By its nature a hotel is a commercial operation. However, the activity of staying in a hotel is more aligned to a residential type use.  |
| To encourage commercial activity in existing buildings where this is required to assist in their conservation.        | As the current building will be demolished this clause does not apply in this instance.   |
| To encourage a mix of uses on the sites in the west and north-west of the Activity Area and fronting Campbell Street. | This site does not front Campbell St – nor is it in the west/north-west of the Activity Area.   |

## 6.5 Use of Land

The subject site is currently underutilised with a vacant office block/warehousing and a commercial car park at ground level occupying the land parcel at 2-6 Collins Street, Hobart. Per the provisions of the Planning Scheme, the proposed uses of Visitor Accommodation (a Permitted use) and Function Centre (Discretionary Use) prescribed in Section 15.3. and effects on amenity as prescribed in subsection 15.3.6. relates to impact on amenity and ensuring any use of land within the Activity Area but not within the Wapping LAP Precinct (as in this case) must not have a detrimental effect on the amenity of the Precinct through:

- Transport of material, goods or commodities to or from the land
- Appearance of any building, works or materials
- Emission of noise, artificial light, vibrations, smell, fumes, smoke, vapour, steam, soot, ash, dust, waste water, waste products, grit or oil.

Once construction is complete there will be ongoing traffic movements to and from the site ferrying guests, supplies (linen, food, beverages, etc) and wastes. Provision is made for 14.5 m coaches and an 8.8 m delivery vehicle to enter the site, turn and leave in a forward direction via Collins St. These areas front Ragged Lane and are screened by a solid wall. The traffic impact assessment (TIA) demonstrates there will be no significant or detrimental impacts on local traffic flows as a result of the proposed development.

Facilities for the storage of waste and linen are located inside the building on the ground level. These are well recessed from the Ragged Lane frontage and are designed to prevent direct access by guests. This area is also screened from public view by a solid wall. The linen areas are located internally while a large enclosed bin store is located immediately outside the building, under the driveway and ramps. Additional

bins are located along the ground level service corridor which runs internally along the western boundary of the building. These areas are enclosed by roller doors. Wastes will be disposed of in accordance with standard requirements for commercial operations. All kitchen areas will have appropriate extraction and filtration systems in place to ensure exhaust emissions do not impact on the amenity of the locality. Mechanical plant will be appropriately screened and/ or enclosed to ensure noise emissions comply with Australia Standards. There will be no impact on amenity of the locality as a result of wastes from the development.

Night lighting will be incorporated into the facade treatment and where appropriate will also highlight landscaping. The facade generally faces away from adjacent areas and proposed illumination and signage are not considered likely to have a detrimental impact on the amenity of the area.

## 6.6 Schedules

Within the Planning Scheme are a series of Schedules which need consideration:

### 6.6.1 Schedule 1 – Conservation of Cultural Heritage Values

#### Places of Cultural Significance

The site is not identified as a Place of Cultural Significance under this Schedule to the Planning Scheme. The building to the south of the site (the Woolstore) is listed as a Place of Cultural Significance (52 on map below).

Figure 8 - Places of Cultural Significance - Sullivan's Cove Planning Scheme

A full heritage assessment report has been commissioned to support this development. The following commentary is taken from that report – the report will be attached to the development application under separate cover.

The criteria for assessment of impact on adjoining Places of Cultural Significance are:

| Criteria  | Comments   |
|---|--|
| <i>'Building or works' adjacent to a place of cultural significance must not dominate that place when viewed from the street or any other public space,</i> | Given the former Roberts woolstore and HCC garage façades are 1-2 storey high and are merely façades with contemporary, larger scale development behind, it is |

| Criteria  | Comments   |
|---|--|
| <p><i>or be more prominent in the street than the adjacent place of cultural significance.</i></p> <p><i>The area of a facade of any new building may be permitted to exceed that of the building on an adjacent place of cultural significance where the Planning Authority is satisfied that the visual impact of the apparent disparity of scale is not significant or that historic precedent warrants the scale disparity.</i></p> | <p>inevitable practically any new development on the subject site will present as a larger scale and prominence than these places of cultural significance in the wider townscape context.</p> <p>This however is not seen as something which is likely to have heritage impact, as the places of cultural significance both derive part of their significance from being representative of the numerous major changes to the pattern of development of the Wapping area and that new development adjacent to these places can be seen as a continuum of that evolution of the area.</p> <p>For over 200 years Wapping has evolved in several distinct stages with larger new forms replacing earlier and smaller scale development in response to the wider evolving townscape – recent developments such as the Old Woolstore apartments, One Collins, Terminus Row and the forthcoming Hedberg Garage development are examples of this new wave and reinvigoration of Wapping which is seen as an acceptable (if not desirable) new phase in the continuum of Wapping's history.</p> <p>To 'under develop' the subject site would perhaps therefore be inconsistent with this precedented tenor of development in the area therefore larger scale development would be consistent with the evolving pattern of development in the area.<sup>1</sup></p> |
| <p><i>'Building or works' must complement and contribute to the specific character and appearance of adjacent places of cultural significance and the historic character of the Cove generally.</i></p>   | <p>As facades, the value of these places is largely limited to their street frontages and contribution to a very limited area of the streetscape and townscape (although noting the visual prominence of the former Roberts woolstore being on the corner of a very busy thoroughfare).</p> <p>Individually they have streetscape value however do not greatly contribute to any cohesive streetscape or character area. This area of Wapping is of a very diverse character with more recent and larger development typifying the latest phase of that area.</p>  |
| <p><i>The location, bulk and appearance of 'building or works' must not adversely affect the heritage values of any adjacent or nearby place of cultural significance.</i></p>  | <p>This document has assessed the heritage values of those adjacent places of cultural significance and has concluded that their predominant significance derives from their ability to represent buildings indicative of major change phases in the Wapping area (i.e. late c19th larger scale commercialisation and Inter-War wholesale site redevelopment) – i.e. Criterion A.</p> <p>Their architectural values (Criterion D) are considered marginal (given that they are only façades and although the places themselves give provide some streetscape contribution they do not form part of any cohesive or important heritage streetscape).</p>  |

<sup>1</sup> Adjacent Heritage Places Conservation Policy – 2 Collins St – Praxis Environment – Sept 2016

| Criteria   | Comments   |
|--|--|
|  | Any new development of the subject site has some potential to backdrop the places of cultural significance – this however is somewhat of a moot point given that these places are façades and that their own development has in effect already set the precedent for larger backdropping development.  |
| <i>'Building or works' must not reduce the heritage value of any adjacent places of cultural significance by mimicking historic forms.</i> | Any development of the subject site should not attempt to emulate any particular historic form. This is particularly important in this location, given the evolving and diverse pattern of use and development of this area it would be undesirable to strongly emulate one particular aspect of that history over others. Nonetheless, subtle visual cues in the design of any new development may be drawn from any of those historic forms as part of an interpretive approach. |

Relating these comments to the development proposal the Praxis report states:

*By the nature of the scale of the proposed development, a greater prominence than the places of cultural significance is inevitable – noting also that those places themselves are backdropped in their own right with new buildings of larger scale immediately behind their façades.*

*The proposed development however provides a key 'courtesy' to the smaller scale street frontage of these places. Although a substantially taller development, the proposal has been formulated in such a way that the street frontages and closely-perceivable form of the building is a four-storey podium, upon which the higher component of the development is stepped back from all edges. This is particularly evident in the immediate adjacency to the former Roberts woolstore façade, where the point of contact with that façade is of the lower form to provide a less abrupt and stepped linkage to the taller portion of the proposed building (not largely inconsistent with the abutment of the existing building). Further the proposed façade has been articulated in such a way that the apparent vertical scale is broken by means of a recessed ground floor and articulation of the lower floors through form, cladding, materiality and tone.*

*From all close vantage points where the relationship between the adjacent places and the proposed development are viewable as a streetscape collective, the proposed development will read as a larger building than those adjacent, however in the scheme of the overall size of the building this design response has adequately mitigated the impact of such size in particular to near vantage points where the scale will not appear inconsistent with the tenor of recent development in the area (noting that this large scale is acceptable, if not desirable, in any case as representing that long-precedented evolution of the Wapping area).*

*The podium will provide the predominant backdrop to the adjacent places and from near vantage. Whilst the tower will be visible as a new element in the wider townscape from more distant vantage points, the perception of the tower will be somewhat disjointed to the near and street level relationship of the proposed development and adjacent places.*

#### Places of Architectural Sensitivity

The site is listed in Table 2 to Schedule 1 as being a place of Archaeological interest – 2 Collins Street, Roberts Store and Offices Ref 7 (see map below).

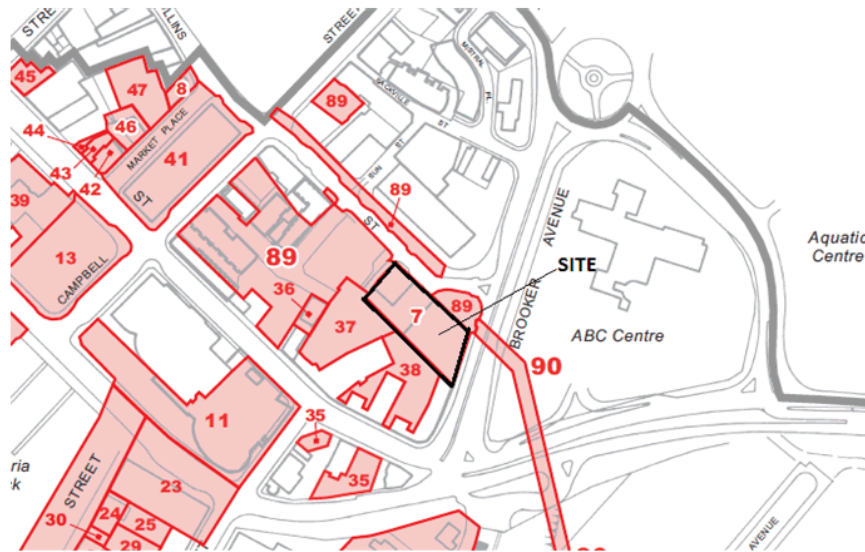

Figure 9 - Places of Archaeological Interest – Sullivan's Cove Planning Scheme

The criteria for assessment of this section are:

| Criteria   | Comment   |
|--|---|
| <i>The likelihood of the proposed 'building or works' resulting in the removal or destruction of items of archaeological significance.</i> | <p>A particular report on Archaeological Impact Assessment and Method Statement has been prepared by Praxis for this development.</p> <p>The report identified the development of this site from first settlement and has broken the site into areas of likely archaeological significance.</p> <p><i>The site generally appears to have been subject to little disturbance, with twentieth-century development being largely on top of (and including) substantial fill to raise the general ground level. This is likely to have encapsulated and protected earlier archaeological remains. The place has the potential to add a greater depth of knowledge on the Wapping area, with a considerable amount of archaeological work having already been undertaken in the area.</i></p> <p><i>A series of research questions have been posed for the site, which demonstrates its potential to add knowledge to key historic themes of importance to Tasmania (and beyond). Accordingly, the following archaeological zoning plan and summary is proposed: (the plan follows this table)</i></p> |
| <i>The cultural significance of the site.</i>  | This aspect is covered in the two Praxis reports.   |
| <i>Evidence of an adequate archaeological reconnaissance and site sampling prior to the</i>  | The archaeological aspects of this site have been researched and discussed by Praxis in their report.   |

| Criteria  | Comment   |
|---|---|
| <i>approval or carrying out of works.</i>   |   |
| <i>The need to reasonably protect potential archaeological significance during the design, and carrying out of works.</i> | As a precautionary principle during demolition and excavation the site will be monitored for any evidence of artefacts from a past era. In the unlikely event that items are found the heritage consultant will be brought into the site to seek advice as to the heritage importance of any finds and to develop a plan to deal with these items. The Praxis report recommends an action plan to deal with artefacts found during works on site. |
| <i>The need to undertake an archaeological 'watching brief' to be required during the carrying out of works.</i>          |   |

Figure 10 - Hierarchy of zones of Archaeological Interest – Praxis Report

Key to figure 10

Green = Low Archaeological Impact  
 Yellow = Medium Archaeological Impact  
 Blue and Red = Part Low and Part High Impact  
 Orange = High Impact

### 6.6.2 Schedule 2 – Urban Form

The Urban Form schedule considers the building/proposal within the context of the streetscape.

#### Building Form

Section 23.6.1A of the Planning Scheme applies in this instance. The factors to consider are:

| Provisions | Criteria   | Comment  |
|------------|--|--|
| Height     | Buildings to the maximum height for the area shown on Figure 8. Parts of buildings above | Compliance relies on a discretion in regard to height. The Planning Scheme |

| Provisions                  | Criteria  | Comment   |
|-----------------------------|---|---|
|                             | <p>building eaves or parapets must reinforce the Objectives of this Schedule. From Figure 8 the height for this part of the Activity Area is 15m. Black Chequered area.</p>   | <p>sets no limit as to the extent of the height discretion. Instead it outlines a series of matters (the objectives to the Schedule) which the Planning Authority should consider when presented with a development which seeks a height discretion. As such then the application of the discretion becomes somewhat subjective. The development and how it relates to the objectives of this Schedule are discussed later in this submission.</p> <p>At 50m the proposed building is lessor in height than the under-construction Hobart General Hospital and comparable to many CBD buildings.</p>  |
| Alignment – Primary Space   | <p>Buildings must be built to the street line of all primary street frontages, with walls located on the front property boundary and extending across no less than 90% of the primary street frontage. Where a new building is located on a corner with two primary street frontages, this requirement must be satisfied for each frontage. New buildings must not step back adjacent to a Primary Space. The only permissible exceptions to this is in situations where the stepping back is less than 1:20 relative to the height of the wall on the property boundary and where there is a wall to the boundary at least 12m high.</p> | <p>The building is setback at ground level 4.0 – 4.2 metres from the building line of Collins St and 3.6m from the Brooker Highway frontages. This triggers a discretion. The setback has been introduced to give a clear distinction between the new structure and the Woolstore heritage building on the adjoining lot. The setback allows the two buildings to be read in their own setting – distinguishing between the two built forms.</p>  |
| Alignment – Secondary Space | <p>Where applicable, buildings must also be built to, or align with, the secondary street frontage.</p>   | <p>N/a – there are no defined secondary spaces associated with this development.</p>  |
| Plot Ratio                  | <p>Buildings must comply with the plot ratio standards referred to in Table A to this Schedule.</p> <p>From Table A – 21m and above 5.0 Plot Ratio.</p>   | <p>The development relies on a discretion in regard to Plot Ratio. In considering this matter the Planning Authority will have regard to:</p> <p><i>Any new buildings or works adjacent to a Place of Cultural Significance and which are not more prominent in the streetscape by strong contrast of scale, height, colour and tone with the buildings constructed on the place, and, which are not detailed in a manner which is similar to buildings of cultural significance or which adopts an “historic” appearance.</i></p> <p><i>Works undertaken in accordance with a Conservation Plan approved by the Planning Authority where required and/or provided.</i></p> <p>There is no Conservation Plan approved</p> |

| Provisions    | Criteria   | Comment  |
|---------------|--|--|
|               |  | for this site. The impact on the Place of Cultural Significance is covered in the Heritage Study by Praxis. The scale of the proposed building is significant – the form setting a new precedent for commercial developments within the Hobart CBD. It is evident the proposal is not an appropriation of the prevalent vernacular – sandstone, Georgian architecture, within the Sullivan's Cove precinct; it does not seek to be. What the proposal does present as is an assertively neoteric, contemporary and articulate manifestation of aspirational design – honest and articulate. At a podium level, the proposal is very much in scale with surrounding development. The tower containing visitor accommodation rises out of the podium at a nominal setback of 12.5m from the podium street facing wall effectively reducing visibility of the tower at street level to negligible. On approach from the west along Brooker Avenue and from the north along the Tasman Highway the scale of the hotel will be patent however its inclusion in a rapidly changing Hobart skyline will not conflict impede or detract from the visual values of Sullivan's Cove nor Mount Wellington. It should be noted distance from the site, relative to land slope, the less relevance a plot ratio is in assessing a development. It should also be noted the urban grain of the Wapping area will not be altered insofar as closing off any existing thoroughfares. At pedestrian level articulated façade treatments will ensure the buildings seem less blend into Hobart's urban streetscape disguising how much of the site is covered by the envelope. |
| Apparent Size | The length of buildings in street edge elevation must not be more than twice the width of the abutting street.   | Whilst the width of the building's façade is greater than twice the width of Collins St, it should be noted a large portion of the façade diagonally faces the turnout from Collins St to the Brooker Hwy, which, is greater than half the width of the proposed façade.   |
| Urban Gardens | Where the construction of a building results in the creation of secondary spaces with public access. These spaces must be fenced at street frontage, landscaped and include facilities for | There are no secondary spaces being created with this development.   |

| Provisions | Criteria                                     | Comment |
|------------|--|---------|
|            | pedestrians as appropriate, such as seating. |         |

### Building Surfaces

The matters to consider in terms of Building Surfaces are tabulated within the planning Scheme:

| Building Surfaces  | Comments  |
|--|---|
| Building Façade to a Primary Space   | The site is identified as having a facade to a Primary Space. The proposed finishes are a combination of: <ul style="list-style-type: none"> <li>• Alucabond or similar spec. cladding</li> <li>• Powder Coated Steel Perforated Mesh</li> <li>• Alucabond or similar spec. louvers</li> <li>• Off Form Concrete Panels</li> <li>• Curtain Wall Glazing</li> <li>• Glazing Suites</li> </ul>                                |
| Building Façade to a Secondary Space   | Not applicable in this instance   |
| Night-Lighting   | Night lighting will be incorporated to accentuate walls of the building when illuminated, and where appropriate also highlight the landscaping.   |
| Building Surfaces to Brooker Avenue and Tasman Highway in Activity Area 2.0              | The site is not within Activity Area 2 and thus this clause does not apply  |
| Surfaces adjacent to nectar bearing native flora (Tasmanian and exotic eucalyptus, etc). | The configuration of buildings and any adjacent nectar bearing native flora will be designed to prevent bird collisions caused by the reflection of such vegetation or sky in glazing and/or unobstructed views through a surface to an outdoor space. Glazing must be consistent with the DPIWE Threatened Species Unit publication "Prevent window collisions: Save our native birds", or achieve comparable performance. |

### Objectives of Schedule 2 – Urban Form

The objectives stated as being relative to Schedule 2 are tabulated below with appropriate comments:

| Objective   | Comment  |
|---|--|
| The traditional urban pattern of Sullivan's Cove is to be conserved. A contemporary adaptation is to be created in development/redevelopment areas. | The proposal will not disturb the urban pattern of development within the Cove; It will however alter the scale of buildings. The proposal does not involve any adaptation of existing buildings nor will its construction affect the road layout. |
| Views to Sullivan's Cove along primary spaces are to be retained, especially to the River Derwent.  | The proposed development will not impede views to Sullivan's Cove along primary spaces; Rather, the tower will function and be used by visitors and locals alike as a landmark within the streetscape from which pedestrians                       |

| Objective   | Comment  |
|---|--|
|   | will be able to articulate their location and orientate the CBD.   |
| Views over the land bounded by Tasman Highway, Brooker Avenue and Liverpool Street from the City and Wapping to the Domain and from the Domain and Tasman Highway to the City are to be retained.                                     | Technically the site is not in the area bounded by the defined roadways. Any views from Collins St to the Domain will be retained – even with this high tower. From within the Wapping residential area (say Terminus Row or Cresswell's Row) there are no views of the Domain. From these spaces the view is buildings of between 3 and 7 levels in height. In terms of views into the City from the Domain it is impossible to retain a view (implies no change) and see a City develop. The proposal will alter the view into the CBD from the Domain. The tower will however present as a light weight structure set on a more substantial podium – scaled to reflect the surrounding commercial buildings. The split between the podium and the tower will only emphasis this light weight structure. The overall height of the building will blend into the CBD streetscape due to the rising topography emanating from the waterfront.  |
| Expression of the Wall of the Cove is to be encouraged where possible.  | The site is set to the rear of the Cove Wall and thus does not conflict with this objective.   |
| The bulk and height of buildings must reflect the natural topography of the Sullivan's Cove Planning Area, the amphitheatre sloping down to the Cove and the Macquarie Street and Regatta Point Ridges.                               | <p>Since the scripting of the principles contained within the planning scheme regarding the amphitheatre features of the City and in particular the Cove, there have been many new buildings approved and built which break this feature. There are many buildings on the waterfront which are as equally visually prominent in their setting as this one would appear. Hobart is at a crossroads in its future – it can keep spreading out (aiming to protect features from an era in which building technologies dictated height) and accept the consequences of urban sprawl or it can realise that by allowing taller development in the central area (realistically this is a central city site) the spread of development into green field areas may be stopped or at least slowed.</p> <p>By continuing to resist change the inevitable product is more of the same – unfortunately land prices make “more of the same” an unsustainable option both financially and in terms of urban futures for a developing capital city.</p> |
| A diversity of building heights and volumes will be encouraged within this over-riding pattern, but buildings must have a respectful relationship to each other and to buildings of identified cultural significance within a street. | The proposal will create a diversity of building height and volumes within a street. The use of a podium at ground level will create a built product which respects the relationship of neighbouring buildings. This aspect is covered in detail within the section relative to Heritage and Cultural Significant Places – refer to the Praxis Report.   |
| New buildings must not be individually prominent in terms of contrast with  | The development is in two distinct parts. The podium is scaled to reflect that of the adjoining buildings in Collins   |

| Objective  | Comment  |
|--|--|
| neighbouring buildings by being significantly higher or having a larger apparent size when viewed in street elevation.   | <p>St. This is the element which will be visible from street level within the Precinct. The tower will be setback 12.5 metres from the podium facade and will read as a slender structure from long distance viewpoints. The split between podium and tower will only emphasis the slender nature of the tower. From street level (Collins St) the tower will not be visible at close quarters. In that respect the development will not be individually prominent when viewed in street elevation.</p>  |
| New buildings should facilitate the creation of 'secondary spaces' on lots in the Cove. Such spaces should be encouraged where they demonstrably create useable pedestrian environments and facilitate pedestrian movement and views.                  | Development of this site for any meaningful use is limited in the way secondary spaces can be developed. Setbacks allow a widening of open areas to give the impression of a greater public domain, even although these spaces will be maintained as part of the hotel development – thus relieving the public purse.  |
| New urban gardens are to be encouraged in secondary spaces only.   | There are no secondary spaces associated with this development.  |
| On the land bounded by the Tasman Highway, Brooker Avenue and Liverpool Street the landscaping should reflect the variety of garden areas and parkland styles that exist in the immediate surrounding area and that mark the transition to the Domain. | The site is not in the area defined in this objective.   |

### 6.6.3 Schedule 3 – Public Urban Space

The site is defined as being part of the "Rear of the Cove" Precinct.

This control applies to the construction, exterior alteration or exterior decoration of any building or the construction or carrying out of any works within the public urban spaces identified in the 'Public Urban Space Types' plan. Clearly, all works are within the title boundary and thus on private land – there will be no works within the public realm and thus this section has no application.

### 6.6.4 Schedule 4 – Signs

Signage as indicated on the architectural plans. It is believed that the proposed signs are reasonable given the scale of the building.

### 6.6.5 Schedule 5 – Traffic, Access and Parking

The proposed development is located on the periphery of the Sullivan's Cove planning scheme area and fronts the Brooker Highway and Collins St. The integrated development includes tourist accommodation, a conference facility, restaurant, gym and associated support facilities. The development also includes parking for 167 cars for use by guests and staff as well as drop off zones for cars and buses on the Collins St frontage.

The site is located within the Inner City Residential (Wapping) activity area however is not within the area included in the Wapping LAP Precinct. A mix of requirements relevant to traffic and parking are outlined in the general scheme requirements, activity area provisions, Schedule 5 and indirectly in the LAP. These are addressed in this section.

A traffic impact assessment (TIA) was prepared to assess the impacts of the proposed development on traffic in the locality and through this key movement corridor of the Sullivan's Cove area. The assessment was prepared in accordance with the Department of State Growth's *Framework for Undertaking Traffic Impact Assessments*.

#### Preferred Future for the Cove (Section 6)

The planning scheme contains a number of statements intended to express the preferred future urban character for Sullivan's Cove and the over-arching direction that development must take. Those relevant to traffic and parking include:

- 6.3 An Ecologically Sustainable Future – the reduced scale of parking facilities and the provision of passenger drop offs for light vehicles and buses encourages the use of public transport. This also reflects the manner in which visitors arrive at Hobart and the proximity to the CBD and its attractions and the availability of public transport options. The proposed development is consistent with the intent of this statement.
- 6.4 Creating a Place for People – the development incorporates an active street frontage with a cafe, restaurant, shop and access to the lobby at street level. Access to parking and delivery areas will be managed at one point on the least visually prominent frontage of the site. This not only reduces the impact of on-street parking but maintains a pedestrian dominated environment, both from a visual and physical perspective. The proposed development is consistent with the intent of this statement.

#### Planning Principles for Management of Activities in the Cove (Section 7)

The scheme also contains strategic planning principles to guide development and to be considered in the design of future development. Those relevant to traffic and parking include:

- 7.3.4 Efficiency Principles
  - Parking supply within the Cove should be designed and administered to facilitate visitor access, rather than CBD commuters and other long-term parking space users. Long term commuter parking within the Cove should be discouraged.
  - The visual dominance of car parking throughout the Cove should be reduced, particularly in the Central Cove area.
- 7.3.6 People in the Cove
  - The Cove is to be promoted and developed as an attractive pedestrian environment.
  - New use and development should ensure that pedestrian amenity and safety is not unreasonably compromised
  - Developments which incorporate convenience facilities, retailing, recreational activity, pedestrian amenity and visual interest will be encouraged at street level.

The parking provided on site will not be accessible to the public and will not be visible from the street. Access to the car park is located on the least visually prominent corner of the secondary street frontage and will not dominate sight lines or interfere significantly with pedestrian activities. An interactive frontage is proposed which incorporates the cafe, restaurant, shop etc and retains existing street art and landscaping. The proposal is consistent with these principles.

#### **Activity Area Provisions (Section 15.2)**

The objectives of the activity area relate to the development of the Wapping area as a transition zone between the commercial functions of the CBD and nearby residential precincts with significant heritage and cultural values. This includes active commercial frontages at ground level and other uses where performance criteria are met.

The consistency with this provision is demonstrated elsewhere in this report however the development proposed includes an active streetscape with commercial activities (cafe, restaurant, shop, business centre and hotel lobby) at ground level, including pedestrian access and the Collins St passenger drop off. The proposed access for pedestrians and vehicles have been located and designed to be consistent with the objectives of the activity area.

#### **Local Area Plan Provisions (Section 15.5)**

The land is not within the Wapping LAP Precinct and therefore the provisions of the LAP do not generally apply, except where specifically referenced in the planning scheme. There is however some cross-over between provisions and it is considered appropriate to address the intent of the LAP as it relates to traffic and parking.

The statement of desired future character for the Wapping LAP area states that the over-riding intent of the LAP is to achieve sustainable development outcomes and good urban design focussed on inner-city living. In line with this, the level of parking provision should be minimal and "located and accessed in a manner that does not diminish the amenity of the street spaces. The number of parking spaces provided represents approximately one third of the number of accommodation units proposed. Parking is provided above street level and is accessed through a controlled point off Collins St. The building maintains a large setback to the Brooker Highway and Collins St and the parking in no way dominates either streetscape. There is a passenger drop off point on the frontage of the development which is consistent with other scheme provisions and which is incorporated into key streetscape elements of the overall design. The proposed parking is consistent with this statement of desired future character.

#### **Schedule 5 Provisions (Section 26)**

In line with the over-arching future use statements and planning principles considered above, the provision of on-site parking is not generally considered consistent with the intent of the scheme as it relates to the protection of aesthetic values and amenity within Sullivan's Cove. Notwithstanding this, Schedule 5 does trigger consideration of the need for parking and indirectly, the provision of parking for certain uses. These provisions also relate to demonstration of a need for parking and consideration of the impact of providing parking on the values of the Cove. The requirements of Schedule 5 are addressed in this section.

#### **26.2 Principles of development**

The scheme contains the following principles for guiding development:

- Development will not be granted a permit unless:
  - (a) It will facilitate the mutual compatibility of public and private transport;
  - (b) It can demonstrate either:

- (i) that it will not create traffic flows and movements that are detrimental to safety or amenity;  
or
- (ii) that any such flows or movements can be accommodated through engineering works or traffic management arrangements – on or off site – that are satisfactory to the Planning Authority;
- (c) It can make adequate provisions for the direction, access, turning and parking of all vehicular traffic;
- (d) It can provide for pedestrian movement, in accordance with the requirements of the Planning Authority.
- Any provision for parking will aim to:
  - (a) Encourage pedestrian and cycle access, amenity and safety; and
  - (b) Address the essential and short term parking demands of customers/visitors in the Cove; and
  - (c) Discourage long term commuter parking within the Cove.

The level of parking provided on site will not negate the need for public transport or discourage pedestrian access to attractions and facilities within the Cove. It will however provide parking for those guests who bring their own vehicle, particularly Tasmanian residents who have limited alternatives to private transport when travelling to Hobart. Providing no parking at all for the development would be counter to the objectives of the scheme aimed at reducing on-street parking congestion and encouraging the development of the locality for tourism and other uses. The restriction of the number of spaces to approximately one third of that recommended in the LAP encourages guests to use alternative means of transport.

The TIA assessed the levels of traffic expected to be generated as a consequence of providing parking on site and determined that road infrastructure within the locality could accommodate the traffic at an acceptable level of functioning upon completion and in the future when background traffic levels have increased.

The traffic management proposed, including entry and exit points, the pedestrian drop off and bus loading area, is sufficient to cater for the level of vehicular and pedestrian traffic likely to be generated by the development. These have been located within the development to minimise impacts on pedestrian pathways and to reduce impacts on sightlines and aesthetic values. Car parking facilities are located above ground level and will not dominate the streetscape. Being located on levels 2 – 4 of the development, it will not be visible from the street. Parking has not dictated the site layout or the design of the building.

Access and manoeuvring areas comply with Australian Standards and can safely accommodate the types of vehicles likely to use the site.

The proposed development includes an interactive pedestrian friendly frontage and includes facilities to facilitate public transport. Staff showers are provided which will suit the needs of cyclists.

### **26.3 Objectives for Traffic, Access and Parking in Activity Areas**

The site is within the Inner City Residential (Wapping) Activity area. This clause states that the car parking objectives to be adopted for this area are those contained within the Wapping LAP (Clause 15.5 of the scheme), even though the site is located outside the boundaries of the LAP.

The provision of any on-site parking must however be considered in light of the over-riding principles for development within the Sullivan's Cove area and the Statement of Desired Future Character for the Wapping area. These both provide for a minimal level of parking to encourage sustainable transport options and design outcomes that result in an interactive, people focussed streetscape.

There are no specific objectives for traffic and parking provided in the LAP however minimum parking requirements are provided. These are discussed in 26.4.3 Parking Standards below. Parking is provided on site however is considered to be consistent with these objectives.

#### **26.4 Guidelines for Development Control**

##### **26.4.1 Traffic Generation**

The LAP Guideline for traffic and parking states that the area should provide an “enjoyable, secure, safe and convenient routes for cars, pedestrians and cyclists”. The provision of parking on site will reduce on street parking pressures and provide convenient, secure parking for guests. Reduction of on-street parking congestion enhances the residential amenity for permanent residents and managed access to and from the development allows for smooth traffic flows along Collins St.

The guidelines for traffic generation provide that development which will result in an increase of traffic shall accommodate that traffic in line with safety requirements and in consideration of amenity. The objectives for the maintenance of amenity within the Sullivan’s Cove area, and the Wapping LAP area more specifically, are outlined above and are included in the following consideration of traffic and parking associated with the proposed development.

##### **26.4.2 Access Requirements**

In line with the guideline in Section 15.5.11 of the LAP, parking has been provided within the development to encourage off-street parking for visitors, maintaining the focus of Collins St and the broader area as pedestrian friendly and a ‘people place’. No ground level parking is proposed with drop off facilities incorporated to ensure the safety of visitors and other pedestrians. The main drop off zone is proposed on the Collins St frontage with coach facilities and delivery vehicle areas proposed on the Ragged Lane frontage (no direct access to the lane is proposed).

Separate access to and exit from parking levels is provided with a two-way 6.6 m wide driveway proposed. Pedestrian access is provided through elevators in the centre of the building accessible via the foyer. This is consistent with and exceeds the requirements of this clause.

##### **26.4.3 Parking Standards**

The proposed development incorporates tourist accommodation, a conference facility and associated gym and dining facilities. When considering the parking requirements for the development, an assumption is made that visitors staying in the accommodation will also use the conference and dining facilities, and vice versa.

Consistent with the principles referred to above, parking is not proposed for all components of the development, instead being based on the rates for Holiday units, a component of the broader Visitor accommodation use for which approval is being sought. Under the provisions of the LAP, this use requires 1 space per unit which would equate to 256 spaces. It is proposed to provide 167 parking spaces with the development.

It is considered that the proposed development provides an appropriate level of parking considering the anticipated number of users and the desired outcomes for streetscape and development of inner city amenity.

##### **26.4.4 Nature of Parking**

Parking is provided within the building and above ground level to minimise impacts on pedestrians, amenity and streetscapes. The car parking layout has been designed to conform with Australian Standards. The number of spaces has been chosen as a compromise to meet the needs of the users of the site while respecting the planning scheme objectives seeking to avoid a proliferation of parking within Sullivan’s Cove.

The TIA determined that the access to and from the building was appropriate and that the road infrastructure in the locality could accommodate the projected increase in the short and long term.

#### 26.5 Matters to be Considered

The TIA demonstrates that the traffic generated by the development will not detrimentally impact on the functioning of any roads adjacent the site, including the Brooker Highway, or in the wider locality which includes the port area. The proposed development does not impact on any key site listed on part of the scheme.

Access to parking areas is provided on the least visually prominent frontage corner of the site (corner of Collins St and Ragged Lane). The TIA indicated very little traffic uses this lane and the location of the access at this point will not disrupt local traffic flows. The location of the access next to the lane consolidates the point of vehicle movements rather than having multiple crossings for pedestrians to negotiate. Location of the parking above street level maintains the pedestrian focus of the streetscape and when coupled with the ground level components of the development, enhances the human scale of the locality and satisfies the planning scheme objectives.

### 6.6.6 Schedule 6 – Subdivision

There is no subdivision involved with this proposal.

### 6.6.7 Schedule 7 – Demolition

Any demolition associated with this proposal relates to the existing Roberts building. Thus, there will be no demolition without an approved development. On that basis, the demolition associated with the proposal complies with this schedule.

### 6.6.8 Schedule 8 – Environmental Management

Not applicable – the proposed use constitutes neither a Permissible 'Level 1' activity nor a Permissible 'Level 2' activity.

### 6.6.9 Schedule 9 – Telecommunication Infrastructure

The proposal will have no impact on telecommunication infrastructure.

## 7. State Policies

The proposal does not impact on any approved State Policies.

## 8. Conclusion

With demand continuing to outstrip supply and Hobarts aging accommodation options failing to keep pace with visitor expectation, it has never been more consequential for the city to adopt and engage with developers seeking to boost, bolster and secure Tasmania's share of the tourist dollar. Whilst initially the proposal may be seen as incompatible with the urban scale of Hobart, the opportunities and confidence the proposal will yield in the way it seeks to engage with the city socially, economically and environmentally will ameliorate any fears the amenity, and unique interconnected precinctual character of Sullivan's Cove has been all but ignored.

The contorted elevation and orientation of the site – a product of Hobart's undulating topography and irregular grid layout – a form which has adapted to Hobarts development since settlement has resulted in a sensitive interface with Brooker Avenue, the Tasman Highway and by fortuity presenting as an opportunity for the adoption of an inspiring landmark at the entrance to the CBD. The area bound by the is in desperate need of rejuvenation and activation. The development and what it will offer insofar as sorely needed

modern lodgings, a functions and exhibition space able host events for up to 1000 people, the addition of food and beverage options in a deficient part of the CBD to service the areas residents and those studying and working at UTAS, the Magistrates Court, the RHH and opposite at the ABC and the number of jobs it will generate both during construction and when open should not be discounted.

The hotel will not only generate significant economic activity, but its development will arguably be further proof – a catalyst for investors, developers and those looking to Tasmania, that our island state is indeed open to change and open for business. The building's form has been designed to sensitively articulate its place within Hobart; the podium– with nuanced references to Tasmania's natural environment through form, materiality and scale affirms the development as wholly sympathetic to surrounding commercial developments. The tower – which is considerably set back from the streets edge will only be seen from height or distance; at ground level, the articulation of the buildings form by inclusion of a taller ground floor and the wrapping of the podium around levels 1 to 5 will create the illusion of a building more in sync with the height and scale of its more vertically restrained neighbours.

The building height will challenge widely accepted building heights in this area, but it will not shirk from its responsibility in addressing the question of density by taking full advantage of the sustained truth Hobart is a developing capital city; To continue with low level development may appease some regarding heritage outcomes but in the long run, without due consideration of intelligent and adaptive land use, underutilisation will lead to further unsustainable urban sprawl with development pushed into green fields.

Fortunately, there is no limit placed on the degree of discretion the Planning Authority can consider in terms of a buildings height. The Authority has only to consider a range of social, environmental and economic matters – consider, not agree with – in arriving at their decision.

Society has various needs and expectations such as protection of the environment, economic well-being, various social needs and, proper management of resources and infrastructure; planning aims to meet these by addressing aspects of social economic, environmental and social wellbeing affected by land use and development. Environmentally – the proposal utilises existing land in the CBD. Visually, some will be challenged by the scale of this proposal - its orientation is sympathetic to the location, encouraging of more robust densities than elsewhere in Hobart. Economically – this scale of development will have a compounding economic impact on the city in terms of employment and new income. Socially – a hospitality development of this scale will draw down on the skills and talents of many looking for work in construction and hospitality. It will also show renewed confidence in the city – signalling Hobart has confidence and is prepared to take the next step in its development as a Capital City.

16.0253 – Collins St Hotel

## 1 Project description

The project consists of a 15 storey hotel in lower Collins Street, comprising eight levels of hotel rooms, three levels of suspended carpark and four levels of mixed use space for hotel guests and the public.

Gandy & Roberts' involvement to date has been limited to providing a partial structural and hydraulic scheme and hydraulic concept servicing documentation during the pre-development application stage. The structural scope has been limited to determining an efficient vertical load path through the building taking into account the architectural and functional constraints imposed upon it. Preliminary sizing of hotel levels slabs, beams and columns has been undertaken to test the available structural space, and ensure that the zones provided by the architect are sufficient. Transfer structures have been sized based on a preliminary load rundown of selected columns. Stability has not been assessed at this stage. The core arrangement is reasonably central within the building, and it is anticipated that with suitably sized concrete walls, and tension piles if required sufficient lateral stiffness can be achieved.

## 2 Briefing information & Design inputs

The following information has been used to inform the structural design.

### 2.1 Building uses

| <i>Location</i> | <i>Function</i>   | <i>Comments</i> |
|-----------------|---|-----------------|
| L00             | Public reception, dining spaces & back of house                           |                 |
| L01             | Conference facilities   |                 |
| L01A            | Administration & storage  |                 |
| L02-L04         | Carpark   |                 |
| L05/ L06        | Podium Level (open terrace), Guest amenities<br>(Pool & wellbeing centre) |                 |
| L07-L14         | Hotel accommodation   |                 |

### 2.2 BCA Classifications

| <i>Classification</i> | <i>Location &amp; extent</i> | <i>Comments</i> |
|-----------------------|------------------------------|-----------------|
| TBA                   |                              |                 |

Building Importance Level = TBA

16.0253 – Collins St Hotel

## 2.3 Fire Rating Levels

| <i>Element</i> | <i>FRL</i>  | <i>Comments</i>   |
|----------------|-------------|---|
| GL-L01         | 180/180/180 | TBC by building surveyor – assumption based on similar projects |
| L02-L04        | 120/120/120 | "   |
| L05-L20        | 90/90/90    | "   |

## 2.4 Construction Sequence

| <i>Element</i> | <i>Location</i> | <i>Comments</i>  |
|----------------|-----------------|--|
| TBC            |                 | Tower crane assumed to be located centrally within hotel lobby |

## 2.5 Architectural considerations

### 2.5.1 Floor finishes

#### 2.5.1.1 Polished concrete

No allowance has been made for increased crack control of structural concrete, or provision of non-structural screeds to accommodate polished concrete floors. Crack control of restrained concrete cannot be guaranteed. Polished concrete floor proposals should be submitted to the Gandy and Roberts for review and comment prior to construction.

#### 2.5.1.2 Setdowns

50mm setdowns have been assumed for ensuites, bathrooms, other wet areas. Infill screeds are non-structural items, and are not covered within the structural scope.

### 2.5.2 Expansion joints and deflections

Expansion joints (if required) will be shown on the drawings. Architectural detailing of non-structural walls and floor finishes which bridge expansion joint locations needs to include corresponding expansion joints in these locations. Selection of expansion joint covers is by the architect – expected range of movement can be provided to assist with selection.

Design deflection limits are as per the table below. Architectural detailing of façade elements, non-loadbearing and operable walls, glazing systems etc. need to take these into account. Deflection figures for specific locations can be provided to assist with detailing.

### 2.5.3 Fire rating

Concrete elements will be designed to accommodate the required FRL, however steel framing elements have no inherent rating. They require protection to achieve the required fire rating via external finish or cladding (ie. intumescent paint, fire rated plaster etc.).

16.0253 – Collins St Hotel

### 3 Structural design

#### 3.1 Structural System

The building will be constructed using the following structural systems:

| <i>Element</i> | <i>Systems</i>  | <i>Comments</i> |
|----------------|---|-----------------|
| Footings       | Large diameter bored piles and pile caps/ground beams             |                 |
| Retention      | None required   |                 |
| Columns        | Insitu and/or precast concrete                                    |                 |
| Walls          | Precast concrete  |                 |
| Floors         | Insitu post tensioned concrete                                    |                 |
| Roof           | Insitu post tensioned concrete or steel frame and sheet           |                 |
| Stability      | Concrete lift and stair cores with compression and tension piles. |                 |

#### 3.2 Loads

##### 3.2.1 Vertical

| <i>Description</i> | <i>Location</i> | <i>DL</i> | <i>ADL</i> | <i>IL</i> | <i>Comments</i>               | <i>Source</i> |
|--------------------|-----------------|-----------|------------|-----------|-------------------------------|---------------|
| Floors             | L00-L01         | SW        | 1.0 kPa    | 4.0 kPa   |                               | AS1170.1      |
|                    | L02-L04         | SW        | 0.5 kPa    | 2.5 kPa   |                               | AS1170.1      |
|                    | L05             | SW        | 5.5 kPa    | 5.0 kPa   | ADL assumes falls and ballast | GR assumption |
|                    | L06 (general)   | SW        | 1.0 kPa    | 5.0 kPa   | IL based on gymnasium loading | AS1170.1      |
|                    | L06 (pool)      | SW        | 17kPa      | 5.0kPa    | ADL based on 1.2m deep pool   | GR assumption |
|                    | L07-L20         | SW        | 1.0kPa     | 2.0kPa    |                               | AS1170.1      |
|                    | All levels      | -         | 6.0 kN/m   | -         |                               | GR assumption |
| Facade             | ...             | -         | -          | 3.0 kPa   | Backprop through two levels   | GR assumption |
| Construction       |                 | 0.5 kPa   | 0.5kPa     | 0.25 kPa  | Steel frame and sheet roof    | GR assumption |
| Roof               |                 |           |            |           |                               |               |

##### 3.2.2 Wind

|                                    |             |
|------------------------------------|-------------|
| Annual probability of exceedance = | 1/500 years |
| Wind Region =                      | A3          |
| Regional Wind Speed                | Vu = 45 m/s |
|                                    | Vs = 37 m/s |
| Terrain Category =                 | 3.0         |

##### 3.2.3 Seismic

|                                      |                     |
|--------------------------------------|---------------------|
| Annual probability of exceedance =   | 1/1000 years        |
| Probability factor (kp) =            | 1.3                 |
| Hazard factor (Z) =                  | 0.03                |
| Site subsoil classification =        | Ce                  |
| Earthquake Design Category (EDC) =   | III                 |
| Structural system =                  | Ductile shear walls |
| Ductility factor ( $\mu$ ) =         | 3                   |
| Structural performance factor (Sp) = | 0.67                |

16.0253 – Collins St Hotel

### 3.3 Deflections

The following deflection limits will apply to the building:

| <i>Element</i> | <i>Location</i> | <i>Condition</i> | <i>Limit</i>                           | <i>Comments</i> |
|----------------|-----------------|------------------|--|-----------------|
| Floor slabs    | All levels      | Long term total  | Span/300 (30mm max)                    |                 |
| Transfers      | All levels      | Long term total  | Span/750 to Span/1000<br>(10-15mm max) |                 |

### 3.4 Vibration

No specific requirements.

### 3.5 Acoustics

No specific requirements affecting the structural design.

## 4 Geotechnical Investigation

A desktop study of the site was undertaken by Scherzic for the former owner. Extracts of the report can be found in Appendix A.

## 5 Design documentation

A series of sketches have been developed to define the vertical load path through the building and to assist the architect with their spatial planning. Piling zones have also been identified to inform the proposed archaeological investigation. Copies of these documents can be found in Appendix B.

Note that this set of sketches incorporates significant changes made to the building since the previous revision of the structural specification.

Although strictly speaking not applicable to the structural specification, hydraulic concept servicing plans have also been included in Appendix B.

## 6 Safety in Design

A design safety report for this project will be prepared as the design develops.

## 7 Certification for Building Approval

Structural certification in accordance with the Tasmanian Building Act will be provided at the completion of the design and documentation phases.

## 8 Contractor's responsibilities

### 8.1 Building permit

The Contractor will be responsible for ensuring that a valid building permit is in place for the work and that the Building Surveyor is notified of all structural site inspection requests.

### 8.2 Construction inspections

At all nominated hold points, the Contractor is responsible for requesting the relevant parties to attend the site and inspect the work. The work shall be complete at the time of the inspection. A minimum of 24 hours notice is required for Gandy and Roberts to attend the site. Do not rely upon facsimile or email to communicate requests - make contact with our office to confirm attendance. Photographic documentation is not an adequate basis to proceed beyond a hold point unless approved by Gandy and Roberts.

Release of hold points can only be authorised by the Building Surveyor and/or Superintendent. As designing engineer, Gandy and Roberts does not have any contractual or statutory authority to do so. Gandy and Roberts attends the site to check for compliance with the design intent only, and we will not inspect the work unless a valid building permit has been issued by the relevant authority.

### 8.3 Temporary works

The Contractor will be required to carry out all temporary works necessary to enable completion of the structure (including the engagement of suitably qualified designers, and is responsible for all associated costs), this includes (but is not limited to) the following:

- Underpinning
- Precast panel propping
- Formwork
- Scaffolding
- Shoring
- Assessment of floors/roofs carrying construction loads in excess of the design load
- Backpropping of suspended slabs

The contractor should ensure that their proposed methods of work are available to Gandy and Roberts upon request for review.

### 8.4 Work Health and Safety

The Contractor shall comply with the State *Work Health and Safety Act, Regulations* and all relevant codes of practice.

The Gandy and Roberts Design Safety Report (refer to Section 5 above) forms an integral part of the project documentation. The report identifies safety risks and proposes control measures to be followed by the Contractor and the Building Operator. Controls and hazards requiring more explanation than in the safety report are highlighted in our drawings with an exclamation mark in a triangle symbol.

Should the Contractor identify omissions or errors in the report related to the scope of Gandy and Roberts' work on the project please contact us.

16.0253 – Collins St Hotel

## 9 Building Specification

### 9.1 General

The following specification sections will be prepared prior to tender for the purposes of describing the structural requirements of the relevant building components only. Additional requirements may be found within the architectural specification.

### 9.2 Specification sections

It is anticipated that the following specification sections will be required for this project:

#### Footing Systems

- 0301 Piling
- 0302 Spread footings

#### Concrete

- 0310 Concrete (combined)
- 0313 Post tensioned concrete
- 0317 Tilt-up concrete

#### Steel

- 0341 Structural Steel

#### Masonry

- 0331 Brick and block construction

Attention: Paul Ransley/Simon Dunne

### **GEOTECHNICAL REVIEW** **2 Collins Street, Hobart**

#### **1 Introduction**

Fairbrother Pty Ltd are proposing to redevelop the above site which could include the following scope of works:

- Demolition of the existing building/s excluding the heritage listed wall on the north-west boundary
- Underground car park (nominal 3.5m excavation)
- 2-3 floors of new commercial tenancies (podium levels)
- Residential / Commercial tower on top of the proposed podium (up to 8 levels)

A copy of the site title is given in Appendix A with the site identified as S.P.2943 which covers an area of 3009m<sup>2</sup>. **Figure 1** below shows a view of the site from the Brooker Highway.

**Figure 1 View from Brooker Highway**

A walkover of the site was undertaken and photographs taken to record salient features. The inspection indicates the site appears to be located in a low lying area (no contours available) and there is efflorescence in lower brickwork in Ragged Lane. Also, obvious to the site is the re-routed Hobart Rivulet which runs under the other side of Collins Street. All this visual evidence supports the conclusion

*Scherzic Pty. Ltd. A.B.N 99 167 712 325*  
*P.O. Box 33, Sandy Bay, Tasmania, 7006*  
*Mobile 0418 385 983*  
*E-MAIL: [info@scherzic.com](mailto:info@scherzic.com)*

that drainage of the site is problematic and ground water below near surface level will be present for many months of the year if not permanently.

## 2 Geological Background

**Figure 2 - The List Geology**

The ListMap of the site identifies an area of surface filling runs through the site which is shown in Figure 2 above.

The geological map of Hobart, scale: 1:25,000, 2010, which is reproduced in Figure 3 below also confirms the segment of filling running through the site. The description of the surface geologies in the map are:

Qa-Quaternary Alluvium (gravel, sand, clay)

Qhmm-Quaternary Man Made Deposits

Qi-Undifferentiated Bay, Estuarine, Deltaic & Alluvial Deposits (sand, gravel, boulders, silt, clay)

Rqph-Triassic Sandstone/Siltstone

Jd-Jurassic Dolerite

*Scherzic*  
Ground Investigations

Figure 3 Excerpt of Geology Map

### 3 Historical Information

David Visentin from Gandy & Roberts provided historical maps and previous geotechnical information surrounding the site. The information reviewed included the 'Jarman' map of Hobart Town, CIRCA 1827 which shows the route of the former 'Newtown Rivulet' passing through the site where geological maps show man-made deposits. The location of this watercourse indicates a scar exists below surface and the original surface slopes toward this watercourse and hence fill soils will be deepest through this route.

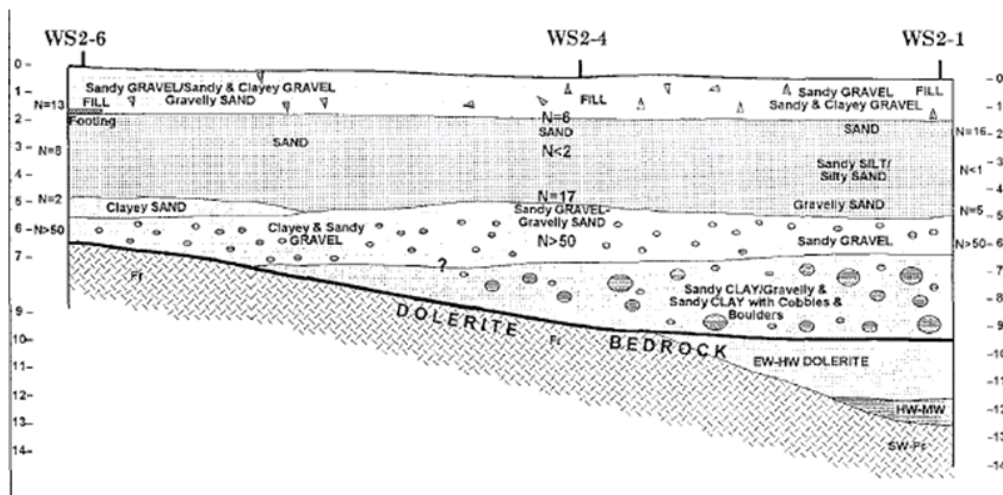

Figure 4 Jarman Map of Hobart Town

*Scherzic*  
Ground Investigations

#### 4 Previous Reports

A report undertaken by Sloane Weldon for the Old Woolstore Buildings in 1999 included a borehole a short distance south east of this site (WS2-6) and a cross section toward Macquarie Street in reproduced below:

This cross section indicates up to 1.5m of filling can be anticipated to the east of 2 Collins Street, which could overlie loose, wet sands with competent rock at below 6.5m depth. This cross section does not traverse the former water course and deeper filling can be anticipated in the former water course passing through the site.

#### 5 Ground Water

As shown above, the existing route of the Hobart Rivulet runs near to the site on the western side of Collins Street and angles across the Brooker Highway toward the River Derwent so some overflows during intense rainfall event can be expected as the site is low lying.

In addition, as shown above, the former water course of the 'Newtown Creek' runs near east-west through the site and the subsequent fill soils are expected to act as a sump for ground water flows in the vicinity of the site. The Sloane Weldon (1999) report found ground water toward Macquarie Street at 2.2m depth. The measured pH was 7.3 which is near neutral so no special treatment of concrete is anticipated.

#### 6 Conclusions and Recommended Investigations

Based on the information presented above, the following subsurface conditions are anticipated over the site:

1. A former 'creek' runs through the site which is backfilled with fill soils. The entire site is likely to have some filling over natural soils
2. The fill soils will be saturated below 2m depth but the ground water depth will vary according to rainfall events

3. The natural soils under the filling are likely to be loose saturated sands prone to liquefaction under seismic loads
4. Gravels, with cobbles and boulders in a sand or clay matrix will exist beneath the sands which have variable properties (problematic for driven piles)
5. Competent Dolerite Rock exists below 6.5m depth.

Given the above, a geotechnical investigation should be undertaken to quantify the fluctuations in ground water, the conductivity of the foundations to 4m depth, and the density/strength of the natural sands. In addition the investigation should provide an estimation of depths of gravels/cobbles/boulders and depth to competent Dolerite. As there is filling of unknown origin and potentially a basement will require removal of the filling from the site, a preliminary assessment (sampling) of any potential soil or water contaminants is recommended during the site investigation. Normally a Preliminary Environmental Assessment is undertaken before any sampling but this can be deferred until more understanding of the development is known.

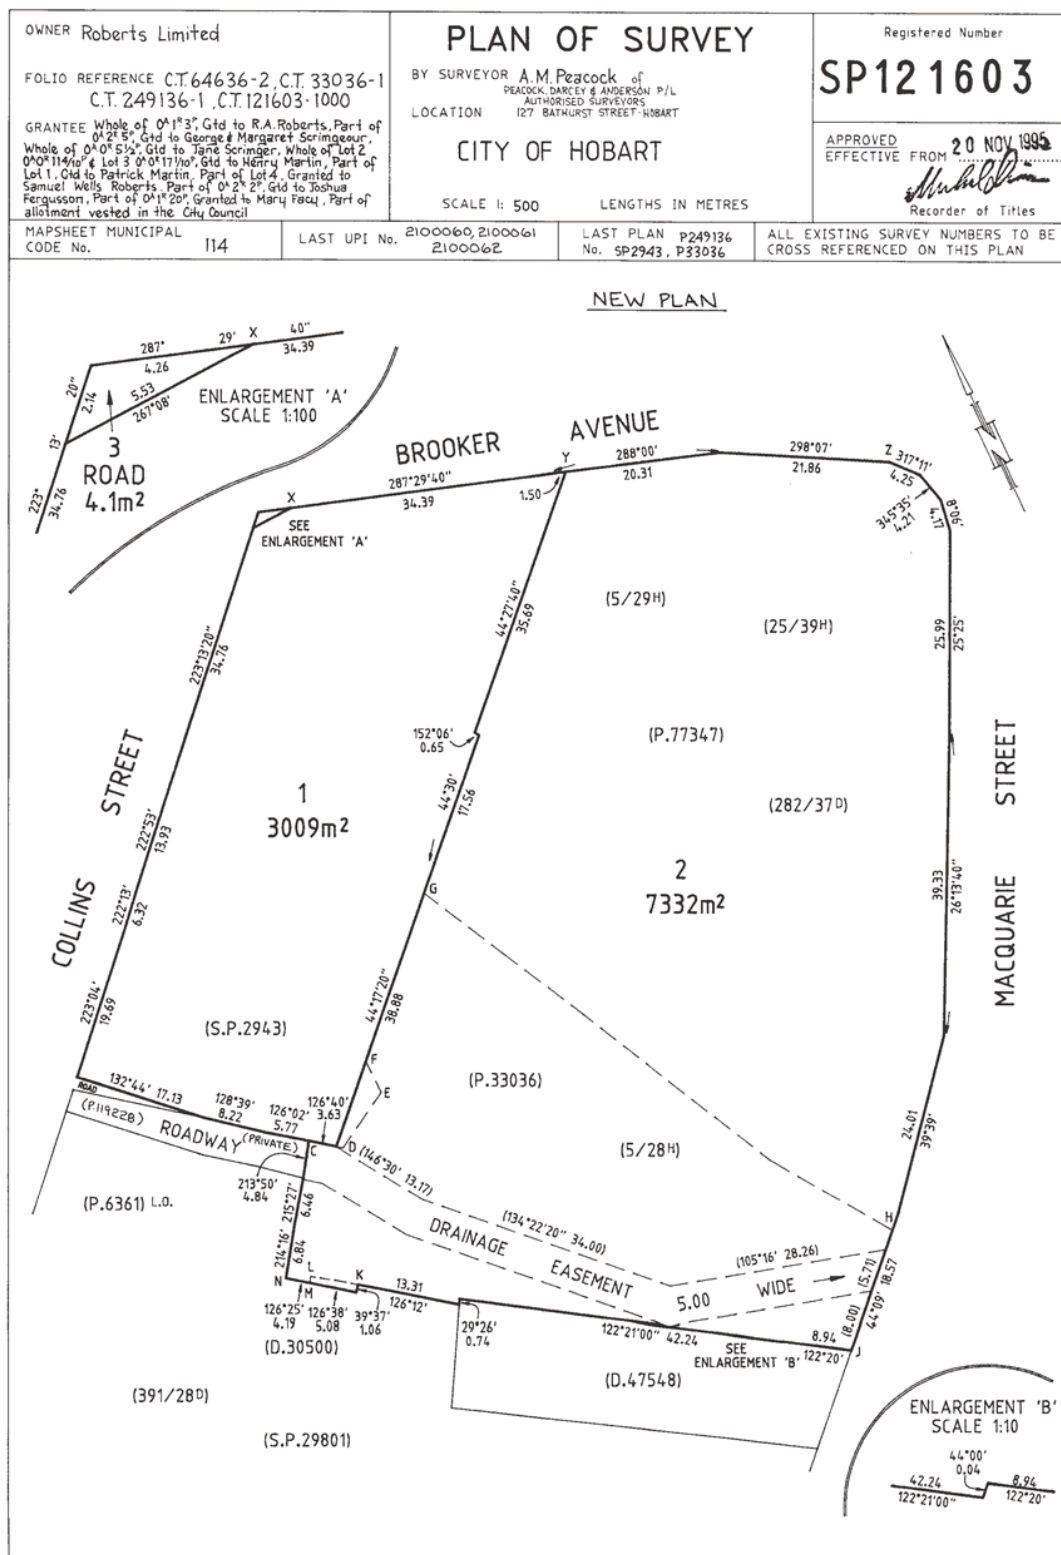

Although not apparent, it may be prudent to review any subsurface heritage/archaeological requirements for the development. If this is required we recommend a review of the geotechnical investigation methodology which could be revised to include Geophysical methods such as Electromagnetics or Ground Penetrating Radar. An investigation of the footings supporting the heritage wall may be prudent with any archaeological assessment.

16.0253 – 2-6 Collins street — Date 06.07.18

## 1 General

The project consists of 2 levels of commercial space; 3 levels of carpark; 1 level for swimming pool, spa and gym facilities; and 8 levels for hotel rooms. The site is occupied by an existing building to be demolished.

## 2 Civil Engineering

### 2.1 Sewer

The concept for the sewer is shown on drawing C010. A new DN225 sewer lot connection is proposed for the western corner of the property extending from an existing sewer manhole adjacent to the property boundary.

Sewer demand for the site is approximately 2857 fixture units with a peak minute flow of 18.1 L/s and an average daily flow of 0.91L/s based on an extrapolation of AS3500.2

### 2.2 Stormwater

The concept for the stormwater is shown on drawing C011. A new DN375 stormwater lot connection is proposed from the existing stormwater manhole adjacent to the NW property boundary.

Stormwater treatment prior to discharging into council mains will be provided via a "SPEL Ecoceptor" and SPEL Hydrosystem HS400.

The expected stormwater design flow for the site is  $Q_{100} = 304\text{L/s}$  (5 minute duration).

Proposed works within Collins Street include the removal of existing kerbing and realigning with new kerbing to suit the new development. Some of the existing council infrastructure will need to be adjusted and extra infrastructure added to suit the proposed works within the road reserve (refer drawing C011).

### 2.3 Water

The concept for the water is shown on drawing C012. A dual DN150 water supply is intended to come off the existing DN200 water main in Collins Street. The dual water supply will service a separate pipe system for each of the fire sprinklers, and for the fire hydrant/domestic and fire hose reel demands. The water connection valves are arranged on the main to allow isolation from one direction and so to maintain flow in the case of a burst or works in the street main.

### 3 Hydraulic Design

#### 3.1 Building Sewer

Connection to the Taswater sewer main will be provided by a gravity system via a DN225 boundary trap located within the property boundary.

The sewer will extend throughout the building via service risers and it is anticipated that the “Studor P.A.P.A” system will be incorporated to satisfy venting requirements.

Below ground grease arrestors to service the commercial portions of the building will be located in the laneway adjacent to the bin store behind the hotel kitchen. This location provides adequate access for cleaning and maintenance.

#### 3.2 Building Stormwater

A siphonic stormwater system is suggested for the building, allowing smaller pipe sizes and pipe runs to be installed without grade.

The siphonic system will reticulate throughout the building via ceiling spaces and service risers.

#### 3.3 Building Water

In order to provide an adequate water supply and pressures in a building of this height, booster pumps are required. There are a couple of options to consider with water supply;

1. Booster pumps with a minimal sized break tank. This will provide adequate water and pressure to service the building with the least cost and building footprint.
2. Booster pumps with onsite water storage. This option would consist of an additional domestic water storage tank to provide redundancy to the hotel should the water be cut off at the street.

We suggest that hot water for the hotel would be provided by a central gas hot water plant with storage tanks and reticulated throughout the building via circulating flow and return pipework located in ceiling spaces and service risers. Separate retail sections of the building would have individual electric hot water units contained within their tenancy.

Water for the fire hose reels in the commercial & retail sections of the building will be provided from the domestic supply.

1 Context .....4

2 Site details .....4

3 Stormwater Treatment System .....4

4 Maintenance Plan .....4

5 Site Stormwater Flows .....5

6 Water Minimisation Strategy .....5

Appendix 1 – Stormwater Main Capacity .....6

Appendix 2 – SPEL Stormwater Management Proposal .....7

## 1 Context

Gandy and Roberts Consulting Engineers have been engaged to provide a civil and hydraulic concept services design for the proposed hotel at 2-6 Collins St, Hobart. As part of the planning approval, there is a Hobart City Council RAI (SW2 & SW4) that requires a hydraulic servicing report to compliment the concept services design.

The required report relates to the “proposed treatment train, including estimations of contaminant removal, water minimising strategies and how stormwater flows from the site relate to the receiving capacity of the existing stormwater main.

## 2 Site details

The proposed development will completely cover the site, and will provide undercover car parking for 167 cars. Total catchment area of 6841m<sup>2</sup> with 100% being impervious. Maximum flow rate of 304L/s. The only source of stormwater pollution of note is due to materials brought in from off the site such as gross pollutants, wind-blown dust and hydrocarbons from vehicles. With the development being an enclosed building covering the site, the water quality risks are very low.

## 3 Stormwater Treatment System

The proposed treatment system is a SPEL Ecoceptor (Primary Treatment) complete with a SPEL Hydrosystem (Tertiary Treatment) which focuses on sediment removal, but also treats nutrients and hydrocarbons. The stormwater quality modelling was undertaken using the MUSIC version 6.2 software to achieve a 91.4% reduction in total suspended solids and almost 54.9% reduction in total phosphorus, 50.5% reduction in total nitrogen. The Ecoceptor & Hydrosystem is located external to the building and is the only stormwater treatment devices proposed for the development.

## 4 Maintenance Plan

The Ecoceptor & Hydrosystem will require regular cleaning as per the manufacturer’s guidelines published on their website. This will be undertaken by the building operators, typically contracted out to a company such as Veolia using a vacuum truck. The Ecoceptor will require a separate pump out of the silt and the hydrocarbons. The design report assumes a frequency of maintenance of 6 months for the first 2 years, with future maintenance subject to regular inspections.

The Hydrosystem has an allowance for one filter change throughout a 10 year period (If required).

16.0253 – 2-6 Collins Street – 16 August 2017

## 5 Site Stormwater Flows

The existing site is 100% impervious, so there is no increase to the existing catchment. Any additional water captured by the proposed hotel façade, is already included within the existing catchment.

An estimated capacity of the existing DN375 stormwater main has been quantified as 360 L/s with 30L/s being taken up from the upstream pits along the footpath. (Refer to Appendix 1)

The maximum flow rate from the site is 304 L/s leaving 26 L/s capacity in the stormwater main. It is also noteworthy that there is a relatively short run to the discharge in the rivulet. Stormwater detention is not proposed for this development.

## 6 Water Minimisation Strategy

There are a number of water minimisation options available that will be considered for the final development with a few listed below.

- Water saving tapware
- Timed tapware in public areas
- Recycling of fire services test water

16.0253 – 2-6 Collins Street – 16 August 2017

## Appendix 1 – Stormwater Main Capacity

**To:** Jarryd Field <[Jarryd@gandyandroberts.com.au](mailto:Jarryd@gandyandroberts.com.au)>  
**Cc:** Enviro Referrals <[enviroreferrals@hobartcity.com.au](mailto:enviroreferrals@hobartcity.com.au)>  
**Subject:** RE: 2 Collins St. Development - Capacity of stormwater system

Hi Jarryd,

As an estimate, the capacity of our DN375 would be 360 l/s. We already have approx. 30 l/s taken up from the upstream pits along the footpath which feed into this (1% event).

Best regards,

## **Executive Summary**

### Section 2

## 2 Executive Summary

SPEL Environmental has been commissioned by Gandy & Roberts to prepare a Conceptual Stormwater Management Plan (CSMP) for the proposed precinct development located at Collins Street, Hobart.

The stormwater quality modelling was undertaken using the MUSIC version 6.2 software. The modelling results (see **Table 2.1**) indicate the 70%, 80%, 45% and 45% reduction targets for Gross Pollutants (GP), Total Suspended Solids (TSS), Total Phosphorus (TP) and Total Nitrogen (TN) respectively can be achieved.

**Table 2.1: Treatment Train Effectiveness**

| Pollutant                     | Inflows (kg/yr) | Outflows (kg/yr) | Reduction Achieved (%) | Reduction Target (%) |
|-------------------------------|-----------------|------------------|------------------------|----------------------|
| <b>Total Suspended Solids</b> | 129             | 11.1             | <b>91.4</b>            | 80.0                 |
| <b>Total Phosphorus</b>       | 0.329           | 0.148            | <b>54.9</b>            | 45.0                 |
| <b>Total Nitrogen</b>         | 2.99            | 1.48             | <b>50.5</b>            | 45.0                 |
| <b>Gross Pollutant</b>        | 2.99            | 3.85E-6          | <b>100</b>             | 70.0                 |
| <b>Flow (ML/yr)</b>           | 1.16            | 1.16             | <b>0</b>               | 0                    |

Stormwater management for the site is achieved using the following devices:

- One (1) x SPEL Ecoceptor 1000
- One (1) x SPEL Hydrosystem HS.400

## **Overview**

### Section 3

### 3 Overview

#### 3.1 Company Background

SPEL Environmental is a market leader in the environmental compliance sector since 1991. During that time, we have established many satisfied customers who return to SPEL Environmental when they require new and more advanced technological solutions and services. SPEL Environmental devotes a great deal of time, effort and financial investment to maintain our position as a market leader in a rapidly developing field. We employ the latest industry knowledge and advancements, providing our customers with the most progressive stormwater improvement technology.

SPEL Environmental develops long term partnerships with our clients and providing on-going technical support which include a comprehensive scheduled service and maintenance program. We take pride in delivering quality workmanship and customer satisfaction that has created a market reputation, taking SPEL Environmental to where it is today. In order maintain this vision and standard, we are heavily committed to Australian manufacturing and site water quality testing programs to control and maintain consistent quality.

SPEL Environmental is committed to the health and safety of its people and protecting the environment in which they work. We understand the challenges associated with a project of this nature and the physical environment involved. Our safety, environmental and quality standards apply to all our people, products and services, providing certainty that the client's safety, environmental and quality requirements are adhered to.

#### 3.2 Introduction

This report has been prepared by SPEL Environmental to accompany and be considered part of a Development Application (DA) for a proposed precinct development located at Collins St, Hobart. The site is located within the catchment of the City of Hobart Council.

### 3.3 Site Locality

The subject site is bounded by Brooker Hwy to the North, Collins St to the West and Ragged Ln to the South. Situated in the City of Hobart Council the site has a total area of 0.3ha (see **Figure 3.1**).

Figure 3.1 Site Location

3.4 Site Layout

The proposed development is presented on **Figure 3.2**.

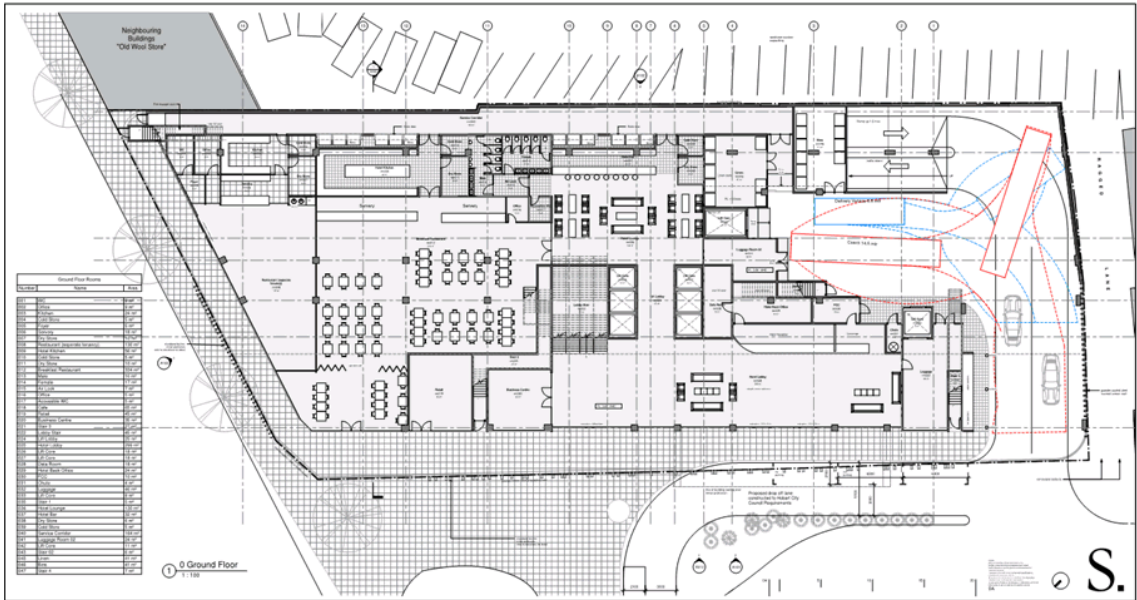

Figure 3.2 Proposed Site Layout

## **Quality Management – Operational Controls**

### **Section 4**

## 4 Quality Management – Operational Controls

### 4.1 Water Quality Objectives

Melbourne Water (2016) requires treatment of stormwater so that annual pollutant loads achieve targets set out in the Best Practice Environmental Management Guidelines (BPEMG). These are:

- 80% reduction in Total Suspended Solids (TSS) from typical urban loads;
- 45% reduction in Total Nitrogen (TN) from typical urban loads;
- 45% reduction in Total Phosphorus (TP) from typical urban loads; and
- 70% reduction in Gross Pollutants (GP) from typical urban loads.

### 4.2 Treatment Train

Based on the site characteristics and the range of available Stormwater Quality Improvement Devices (SQIDs), this study has developed an overall concept that will satisfy the requirements of downstream environmental protection. **Figure 4.1** shows a schematic representation of the proposed treatment train elements.

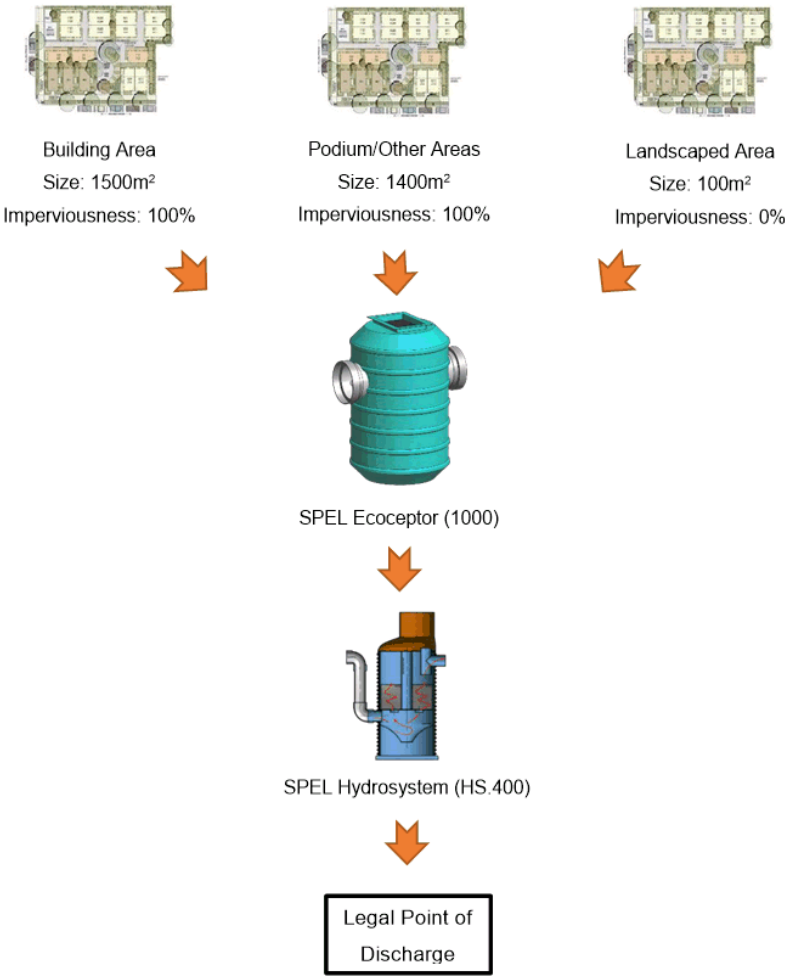

Figure 4.1 Treatment Train Schematic

#### 4.2.1 SPEL Ecoceptor – General Information

The SPEL Ecoceptor™ is vertically configured, single chamber fibreglass Stormwater Quality Improvement Device (SQID) designed for use in stormwater drains (see **Appendix 1**). The Ecoceptor separates and captures gross pollutants, sediments and silt including light liquids (petroleum hydrocarbons). These, in turn, rise to the top of the chamber (below invert) and are secured in the separation zone till the system is maintained.

- **Vortex separation** - The SPEL Ecoceptor™ has a hydraulic force on incoming flows which produce a vortex cleaning action preventing captured pollutants, including fine TSS, from resuspending and discharging.
- **Ease of maintenance** – The cylindrical shape of the SQID with its tapered base (there are no square corners) affords efficient, effective and thorough cleaning of accumulated pollutants; *this process is always done without the need of jetting and hosing the accrued mass of pollutants in the base of the system, a process which is common to all concrete systems.*

SPEL engages ongoing site tests for water quality of the Ecoceptor devices continually across a wide spectrum of catchments on Australia's east coast. We have pleasure in submitting the following independently analysed NATA test results:

- **TSS** - Lab, site testing in conjunction with flow modelling reveals reductions of >80% of TSS.

Figure 4.2: Flow in the SPEL Ecoceptor

#### 4.2.2 SPEL Hydrosystem – General Information

The SPEL Hydrosystem is a tertiary stormwater treatment filtration device targeting known pollutants of concern including Total Suspended Solids (TSS); Nutrients (TP & TN); Gross Pollutants; as well as Heavy Metals (i.e. Cu, Zn, Pb). This specialist stormwater filtration system is installed within conventional concrete manholes, polyethylene and fibreglass shafts. The pre-fabricated and pre-assembled SPEL Hydrosystem is quickly and safely installed using onsite diggers (see Figure 4.3 below). This system is designed for an array of applications with treatment flow rates ranging from 2.5l/s up to 144l/s. The Hydrosystem is designed in an off-line configuration and operates at full treatment flow with a hydraulic fall of 250mm across the system.

Figure 4.3: SPEL Hydrosystem (SHS.1000) installation using onsite digger

##### 4.2.2.1 International Validation and Testing

SPEL Hydrosystem have been lab and field tested by several Universities and Institutes across Germany. The German Institute for Structural Engineering (DIBt) granted a general technical approval (Z-84.2-4)<sup>1</sup> passing all test conditions under heavy trafficable conditions. Field test data has been obtained across Germany including Bremer Straße in Hamburg-Harburg<sup>2</sup> reinforcing the above approval.

**Function Principles:**

1. The rainwater from the connected area is fed into the basal section of the filter housing. The angled inlet generates a radial flow pattern.
2. The hydrodynamic separator converts turbulent waters into a radial laminar flow pattern, generating particle sedimentation, particularly of the sand fraction.
3. This takes place over an inlet to the lower section of the filter shaft. The sediment is retained in a silt trap chamber below the separator. The silt trap needs to be emptied out at intervals.
4. In the central section of the filter housing is the actual filter,
5. Filter Element: Metal. The filter element filters out the fine materials in an up-flow process and dissolved materials are precipitated and adsorbed. The filter can be backwashed. When exhausted the filter is easily exchanged.
6. The filter element is easily pulled up via shaft openings.
7. Above the filter element is the clean water. It passes via a blockade of light substances and then flows over the outlet into a soak away.

**Schematic of SPEL Hydrosystem Process****Product Components:**

1. Rainwater Inlet (DN 200).
2. Angled Inlet.
3. Separator Chamber.
4. Silt Trap.
5. Filter Elements (4 No.).
6. Removal Device for Filter Element.
7. Overflow.
8. Blockade of light substances and suction pipe
9. Outlet to storage or to waste.
10. Locking buoyancy control system

**Schematic of SPEL Hydrosystem Components****4.3 Maintenance Procedure**

The SPEL treatment train specified above is an engineered stormwater treatment solution for the reduction in TSS, nutrients, gross pollutants and hydrocarbons. The Stormwater Quality Improvement Devices (SQIDs) identified in the stormwater treatment solution will require on-going maintenance for a prescribed period as specified by their respective council/authority. A draft of the proposed treatment train maintenance contract can be seen in **Appendix 2**.

## **Quality Analysis - MUSIC**

### Section 5

## 5 Quality Analysis – MUSIC

Water quality modelling has been undertaken of the post-development (mitigated) scenario using the Model for Urban Stormwater Improvement Conceptualisation (MUSIC) software to demonstrate the load based reduction targets are achieved. A stormwater treatment train has been developed and modelled to determine the effectiveness of the proposed system in achieving the relevant water quality objectives.

### 5.1 Rainfall and Evapotranspiration Parameters

Table 5.1 summarized the meteorological and rainfall-runoff data used in the MUSIC model.

**Table 5.1 Meteorological and Rainfall Runoff Data**

| Parameter                 | Value        |
|---------------------------|--------------|
| Rainfall station          | 04008 Hobart |
| Time step                 | 6 minute     |
| Modelling period          | 1993         |
| Mean annual rainfall (mm) | 517 mm       |
| Evapotranspiration        | 895 mm       |

### 5.2 Catchment Parameters

Based on the proposed land uses within the development, the subject site has been modelled as an urban source node. The rainfall-runoff parameters and pollutant generation parameters are based on parameters recommended by Melbourne Water (2016) (Tables 5.2 and 5.3).

**Table 5.2 Rainfall Runoff Parameters**

| Parameter                           | All Nodes |
|-------------------------------------|-----------|
| Rainfall threshold (mm)             | 1.0       |
| Soil storage capacity (mm)          | 120       |
| Initial storage (% capacity)        | 25        |
| Field capacity (mm)                 | 80        |
| Infiltration capacity coefficient a | 200       |
| Infiltration capacity exponent b    | 1         |
| Initial depth (mm)                  | 10        |
| Daily recharge rate (%)             | 25        |
| Daily base flow rate (%)            | 5         |
| Daily deep seepage rate (%)         | 0         |

Table 5.3: Pollutant Export Parameters for Urban Sites

| Catchment ID   |                             | Total Suspended Solids<br>[log (mm/L)] |                   | Total Phosphorous<br>[log (mm/L)] |                   | Total Nitrogen<br>[log (mm/L)] |                   |
|----------------|-----------------------------|--|-------------------|-----------------------------------|-------------------|--------------------------------|-------------------|

|                | Base Flow<br>Concentration  | 1.1                                    | 0.17              | -0.82                             | 0.19              | 0.32                           | 0.12              |

### 5.3 Treatment Node Parameters

The following sections describe the modelling parameters applied to MUSIC for each of the treatment nodes included as part of the water quality assessment.

#### 5.3.1 SPEL Ecoceptor Parameters

SPEL engages ongoing site tests for water quality of the Stormceptor devices continually across a wide spectrum of catchments on Australia's east coast. The SPEL Stormceptor parameters utilised within MUSIC are summarised in **Table 5.4**:

Table 5.4 SPEL Ecoceptor Treatment Node Parameters

| Catchment ID  | SPEL Ecoceptor |
|---|----------------|
| Are the proposed pollutant reduction efficiencies independently verified using a method suited to local conditions?       | Yes            |
| Does the data provided include performance results under dry weather flows (to account for potential pollutant leeching?) | Yes            |
| Is the assumed high-flow bypass rate consistent with manufacturer specifications?   | Yes            |
| High Flow by-pass (m³/s)  | 0.024          |
| Low Flow  | 0.000          |
| TSS Input (mg/L)  | 100            |
| Output (mg/L)   | 31             |
| TN Input (mg/L)   | 100            |
| Output (mg/L)   | 79             |
| TP Input (mg/L)   | 100            |
| Output (mg/L)   | 6.7            |
| Gross Pollutants Input (mg/L)   | 15             |
| Output (mg/L)   | 0              |

### 5.3.2 SPEL Hydrosystem Parameters

A generic node has been utilized in MUSIC, for the purpose of simulating treatment efficacy of SPEL Hydrosystem and the transform function in the node has been modified based on SPEL Environmental's 2nd and 3rd Party field testing product data. These test results and papers are available upon request from SPEL Environmental. The SPEL Hydrosystem parameters utilised within MUSIC are summarised in **Table 7.5**.

**Table 7.5: SPEL Hydrosystem Parameters**

| Catchment ID  | SPEL Hydrosystem |
|---|------------------|
| Are the proposed pollutant reduction efficiencies independently verified using a method suited to local conditions?       | Y                |
| Does the data provided include performance results under dry weather flows (to account for potential pollutant leeching?) | Y                |
| Is the assumed high-flow bypass rate consistent with manufacturer specifications?   | Y                |
| High Flow by-pass (m <sup>3</sup> /s) (for each separate system)  | 0.0025           |
| Low Flow  | 0.000            |
| TSS Input (mg/L)<br>Output (mg/L)   | 1000<br>90       |
| TN Input (mg/L)<br>Output (mg/L)  | 50<br>26.5       |
| TP Input (mg/L)<br>Output (mg/L)  | 5<br>2.95        |
| Gross Pollutants Input (mg/L)<br>Output (mg/L)  | 15<br>0          |

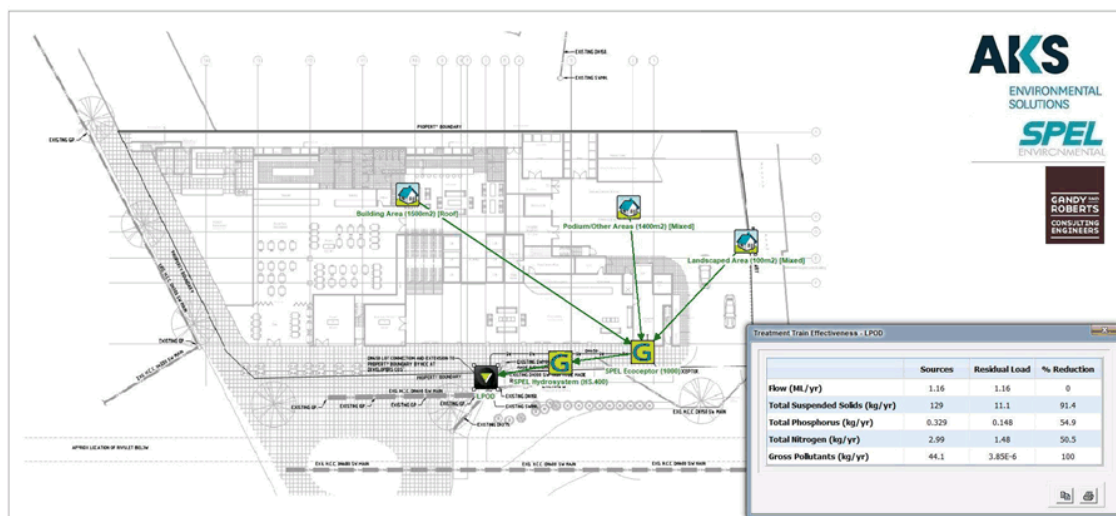

#### 5.4 MUSIC Results

Results of the MUSIC modelling for the treatment train effectiveness are summarised in **Table 5.6**. The results indicate the 80%, 45%, 45% and 70% reduction target for TSS, TP, TN and gross pollutants respectively are achieved. A screen capture of the MUSIC modelling results is included as **Figure 5.2**.

**Table 7.6: Treatment Train Effectiveness**

| Pollutant                     | Inflows (kg/yr) | Outflows (kg/yr) | Reduction Achieved (%) | Reduction Target (%) |

## Summary and Recommendation

### Section 6

## 6 Summary and Recommendation

Based on the water quality assessment using the MUSIC software, it is found that the pollutant reduction targets can be achieved by adopting the SQIDs specified in **Table 6.1**.

**Table 6.1: Recommended Stormwater Quality Improvement Devices**

| Stormwater Quality Improvement Device | Quantity |
|---------------------------------------|----------|
| SPEL Ecoceptor (1000)                 | 1        |
| SPEL Hydrosystem (HS. 400)            | 1        |

The recommended SQIDs are designed to capture stormwater at the downstream end of the drainage network and treat the runoff prior to discharging into the local waterway. The pollutant reduction targets achieved (as modelled in MUSIC) are summarised in **Table 6.2**.

**Table 6.2: MUSIC modelling results**

| Pollutant                     | Inflows (kg/yr) | Outflows (kg/yr) | Reduction Achieved (%) | Reduction Target (%) |
|-------------------------------|-----------------|------------------|------------------------|----------------------|
| <b>Total Suspended Solids</b> | 129             | 11.1             | <b>91.4</b>            | 80.0                 |
| <b>Total Phosphorus</b>       | 0.329           | 0.148            | <b>54.9</b>            | 45.0                 |
| <b>Total Nitrogen</b>         | 2.99            | 1.48             | <b>50.5</b>            | 45.0                 |
| <b>Gross Pollutant</b>        | 2.99            | 3.85E-6          | <b>100</b>             | 70.0                 |
| <b>Flow (ML/yr)</b>           | 1.16            | 1.16             | <b>0</b>               | 0                    |

## Introduction

The SPEL Ecoceptor is a hydrodynamic stormwater quality improvement device (SQID) that has a unique treatment action producing low velocity conditions producing discharge water quality outcomes complying to statutory guidelines across Australia. It has been independently tested in Australia and is suitable for all types of conditions and soil-type loadings.

It separates and captures sediments, silt, total suspended solids, nutrients and total petroleum hydrocarbons (TPH) and oil and grease. TPH and oil & grease rise to the "oil-capture" zone of the treatment chamber and are contained in all flow events. Captured pollutants cannot resuspend or scour from the treatment chamber in all flow events.

Areas with a high fraction of impervious surfaces, including car parks, ports, streetscapes, roads, subdivisions and industrial estates that require stormwater treatment are ideal for the SPEL Ecoceptor. MUSIC node is available on request.

The one-piece, self-contained fibreglass construction, is lightweight and yet robust in strength making it simple and cost-effective when performing installations.

No site assemblage is required as is the case with the heavier concrete devices. The SPEL Ecoceptor fibreglass SQID can be installed in all types of trafficable zones, including vehicular truck (Class D) and aircraft loadings (Class G).

The cyclindrical shape of the SPEL Ecoceptor with its sloped cone-configured base ensures sediment accretes at the centre of the SQID's base affording easy and simple cleaning.

The fibreglass gel coat ensures that oil and grease are removed without sticking to the sides of the internal walls.

Flow rates on standard units of up to 1400 LPS and can fit pipe sizes from 225mm to 1200mm (other sizes available on request.)

# Maintenance

## INSPECTION AND CLEANING

The regularity of inspections of the SPEL Ecoceptor is contingent on the features and properties of the catchment area.

SPEL recommends an inspections of the Ecoceptor at the end of the first month after installation to determine the volume of trapped silt and pollutants.

Information sourced can be useful in factoring the frequency of on-going inspections or cleaning operations.

In the event of excessive rain or an oil spill, an inspection is recommended immediately upon such an event.

Ascertain silt depth and if build-up is evident, then a vacuum-loader truck should be engaged for the cleaning of the tank.

SPEL Ecoceptor cleaning procedure is simple, by simply lifting the external lid (two persons may be required), resting it securely in a safe manner and then inserting suction hose into the chamber.

Ensure that the chamber is thoroughly cleaned of all refuse and debris before accessing the chamber - if required.

The chamber is cleaned by inserting the suction hose through the manhole at ground level.

Always commence cleaning from the inlet side of the chamber and ensure on completion of the cleaning operation that the lid is secured to its normal position (and locked if necessary) before departing the site.

## IMPORTANT

In the unlikely event of the chamber having to be entered ensure absolutely that all Workplace Health and Safety directives and Confined Space Regulations are strictly adhered to, including wearing long-arm rubber gloves and the appropriate footwear in the event of coming into contact with sharp objects.

## SPELFilter Hydrosystem

Environmentally aware and efficient.

[www.spel.com.au](http://www.spel.com.au)

**SPEL** ENVIRONMENTAL  
INTEGRATED WATER SOLUTIONS

## The Technology

A specialist rainwater filter, designed for installation within load bearing shafts and chambers of concrete or plastic construction. The pre fitted plastic housing is safe and easy to fit at site.

The Hydrosystem 1000 Filter uses an up-flow process. This means there is a minimal head drop between the inlet and the outlet. The cleaned water is of an outstanding water quality. The rainwater is treated within the unit by the following processes: sedimentation, filtration, adsorption and precipitation.

The initial treatment steps take place in the Dynamic Separator, where sedimentation of solid particles occurs within a radial flow regime, characterised by secondary flows.

A settling funnel to the silt trap chamber entrance ensures sediments are not remobilised. Above the separator are the filter inserts, covering the entire diameter of the unit's housing, where the second treatment step takes place.

Water flows upwards through the removable filter element. As a result of both the upward flow within the filter element and the fact that the filter remains saturated, the rate of filter clogging by solids is both very limited and slow.

The filter inserts are easy to exchange.

## How it works

1. The stormwater from the drained area is fed into the inlet, which is at the lower end of the shaft. A deflector plate sets up a radial flow.
2. Here, sedimentation of particles, especially the sand fraction and above, takes place in the hydrodynamic separator. This is due to turbulent secondary flows within a radial laminar flow regime.
3. The settleable solids are collected via an opening in the silt trap chamber. This chamber is evacuated periodically, via the by-pass central tube at intervals.
4. Four filter elements are located within the filter shaft. As waters flow upwards the finer particles are filtered out, whilst the dissolved pollutants are precipitated and absorbed. The filter is easily backwashed, and if completely clogged or exhausted, is easily replaced.
5. Clean water above the filter elements passes to discharge via an oil trap assembly. In the event of major spill, free floating oils etc are retained here. Normal concentrations of dissolved oils are retained within the filter elements.

## Technical Data

Stormwater filter complying with DIN 1989-2. Connections: DN 200; the various types of filter elements have different material structures.

Housing material: Polyethylene  
Housing weight: 68 kg  
Total weight: 220 to 350 kg  
depending on filter type

**Packing unit SPEL Hydrosystem 1000:** Pallet: 1 piece

## Accessories 1

SPEL Filter element  
Weight per filter element:  
34 kg (roof / traffic)

## Accessories 2

SPEL Filter element  
Weight per filter element:  
54 kg (heavy traffic)  
66 kg (metal)

Example: Installation in a shaft made of plastic

### Example:

The SPEL Hydrosystem 1000 traffic installed in a concrete shaft DN1000.

### Product structure:

1. Stormwater inlet (DN 200)
2. Deflector plate
3. Hydrodynamic separator
4. Silt trap
5. Filter element
6. Extraction aid for filter element
7. Overflow and suction pipe
8. Oil trap
9. Outlet stormwater storage, soakaway system or surface waters
10. Buoyancy restraint for filter elements

The SPEL Hydrosystem is available with various filter types, depending on the usage of the connected area. The Roof type is used for roof areas that do not have a significant proportion of uncoated metals; the Metal type is employed for metal roof areas, and the Traffic type is used for slightly polluted traffic areas.

The Heavy Traffic type is employed for heavily polluted traffic areas and has been granted general technical approval (Z-84.2-4) by the German Institute for Structural Engineering (DIBt). The maximum areas that may be drained depend on the nature of the surfaces. These are given in the following table.

| Type   | Nature of the surface to be drained  | Weight of filter element / piece | Total Weight |
|--|--|----------------------------------|--------------|
| Heavy traffic with technical approval (Z-84.2-4) | Highly polluted traffic areas (car parks in front of supermarkets, main roads, HGV access roads) | 54kg                             | 300kg        |
| Traffic  | Slightly polluted traffic areas (side streets, staff car parks, yards)                           | 34kg                             | 220kg        |
| Roof   | Roofs without a significant proportion of uncoated metals (< 50m²)                               | 34kg                             | 220kg        |
| Metal  | Roofs made of uncoated metals (copper, zinc, lead)   | 66kg                             | 350kg        |

1 Aims of the German working group on water issues of the Federal States and the Federal Government (LAWA) for surface water, usage as potable water (1998).

2 Permissible of the German Drinking Water Ordinance (2001). 3 Control value for seepage of the German Federal Soil Protection Act an Ordinance (1999) according to § 8 1,2. 4 The aims of the system refer to average annual loads.

## Installation

**CAUTION! Important information, please observe.**

### The following is to be checked before installation:

The filter must be installed with a so-called fall. This means that the incoming pipe (stormwater inlet) is led downwards just ahead of the shaft and can be connected to the lower connection as described.

The difference in invert between the incoming pipe and the outlet to discharge must be at least 250mm.

**Appendix 2 – Draft Treatment Train Maintenance Contract**

**SPEL STORMWATER QUALITY TREATMENT DEVICE MAINTENANCE AGREEMENT****FOR****Collins Street Hotel  
Located at 2-6 Collins St, Hobart**

This Equipment Maintenance Agreement (the "Maintenance Agreement") is made and effective

**[DATE],**

BETWEEN: AKS Industries Australia Pty Ltd (the "Service Provider"), of  
191 Station Street, Corio VIC 3214 (ABN: 88 151 483 984) hereafter known as AKS

AND: **[EQUIPMENT OWNER]** (the "Client"), of  
**[COMPLETE ADDRESS]**

**SUMMARY**

**This 10 year maintenance contract covers the maintenance of the SPEL Ecoceptor and the SPEL  
Hydrosystem at the Collins Street Hotel  
Located at 2-6 Collins St, Hobart**

Where the Client has requested the provision of maintenance and the Service Provider is willing to provide such services as per the terms of this agreement both parties agree to:

**1. WARRANTY:**

The standard warranty on the SPEL Ecoceptor and SPEL Hydrosystem is 12 months. Goods sold shall only have the benefit of a manufacturer's warranty if the purchaser has complied with the manufacturer's instructions in relation to installation, maintenance and operation of the said goods.  
AKS also holds a 25 Years on the fibreglass construction (as per our warranty certificate).

**2. MAINTENANCE CALLS:**

Service Provider agrees to provide maintenance services of maintenance calls and interim calls as required at the installation address specified above on the equipment listed. All charges specified are those currently in effect and are subject to change only at the time of subsequent annual renewal. If the charges are increased, the Client may, as of the effective date of such increase, terminate this Agreement by written notice to the Service Provider. Otherwise, the new charges shall become effective upon the date specified in the renewal invoice. Client calls hereunder are restricted to the normal working hours of the Service Provider.

All service commenced outside of Service Provider's normal working hours will be charged at published rates for service time and expense only.

**3. SERVICES:**

The following services are included:

**Maintenance Summary**

The SPEL treatment systems will be inspected in accordance with the respective Maintenance Manual procedures. The SPEL Hydrosystem change out maintenance process comprises the removal and replacement of each SPEL Hydrosystem cartridge and the cleaning of the silt out of the vault or manhole with a vacuum truck. In the event these works are required, Client will be notified accordingly. The AKS personnel that enter the tank [if necessary] will be trained in confined space entry

**Life Cycle Cost (LCC)** – The maintenance requirements for the Stormceptor and the Hydrosystem is very site specific and actually relates to the sediment load and sediment characteristics.

**Maintenance Triggers**

The basic activities included in the maintenance contract are as follows:

- Visual inspection of the vault and filter conditions annually
- If there is a silt build up, it needs to be vacuumed out accordingly
- TSS accumulation in the filters is what dictates the life cycle of individual filter.

Optimum performance of the equipment covered by this Agreement can be expected only if supplies provided by, or meeting the specifications of Service Provider are used. Service Provider shall have full and free access to the equipment to provide service thereon. If persons other than Service Provider's representatives perform maintenance or repairs, and as a result further work is required by Service Provider to restore the equipment to operating condition, such repairs will be billed at Service Provider's published time and material rates then in effect.

**4. ANNUAL RATE FOR SERVICES:**

| ACTIVITY   | FREQUENCY [subject to site characteristics]   | VALUE [subject to CPI index]  |
|--|---|---|
| <b>SPEL Ecoceptor</b> - Visual inspection for hydrocarbon and silt depth.<br><b>SPEL Hydrosystem</b> - Visual inspection for sediment accumulation   | Year 1 & 2 - Every six months<br>Year 3 - 10 - Annually   | \$250.00+GST per site visit for this project.<br>The ten (10) year total for inspections is \$3,000.00+GST  |
| <b>Silt Removal</b><br>When required the SPEL Ecoceptor and SPEL Hydrosystem will need the silt vacuumed out.<br>AKS will supply vacuum truck and labour to maintain the system.   | This is dictated by silt condition on the site, detected through the site inspections.<br>AKS have allowed for one (1) maintenance supervision per annum. | AKS supervision will be \$375.00+GST / visit, additional equipment (Sucker truck ect) will be on a cost plus basis.<br>The ten (10) year total for maintenance (excluding sucker truck) is estimated \$3,750.00+GST |
| <b>SPEL Hydrosystem</b> replacement – allowance for one filter change out of each SPEL Hydrosystem throughout a 10 year period (If required)   | We estimate the life of the SPEL Hydrosystem to be between 5 – 7 years, subject to silt condition on the site.  | The replacement value is \$3,495.00 per SPEL Hydrosystem inclusive of the labour, management and labour for the day   |
| <b>SUMMARY</b>   |   |   |
| Based on the selection above the, annual rate is \$1,024.50+GSTp.a. This comprises of the above inspection schedule, maintenance, filter replacement and associated reporting spread over the 10 year contract. The annual rate shall be paid in advance as at the renewal date each year. The annual rate shall be indexed by CPI at each annual renewal date (If applicable). Any payment not made by the 30 <sup>th</sup> day of the month shall be considered overdue and in addition to Service Provider's other remedies, Service Provider may levy a late payment charge equal to 4% per month on any overdue amount. |   |   |

**5. PAYMENTS:**

For service as specified above on the equipment listed, the undersigned Client agrees to pay in advance the total annual charge specified below to Service Provider, in accordance with the terms specified on the face of the invoice.

There shall be added to the charges provided for in this Agreement amounts equal to any taxes, however designated, levied or based on such charges or on this Agreement, or on the services rendered or parts supplied pursuant hereto, including GST.

**6. BINDING AGREEMENT:**

The undersigned Client represents that he is the owner of the equipment, or that they have the owner's authority to enter into this agreement.

This Agreement is subject to acceptance by Service Provider. It takes effect on the date written above and continues in effect for ten years and will remain in force thereafter, with automatic annual renewal at the indexed rates, until cancelled in writing by either party or at the end of a 2 year period – whichever is earlier.

IN WITNESS WHEREOF, the parties hereto have executed this contract as of the day and year first above written.

## 1. Introduction

It is understood that a Development Application is to be lodged with City of Hobart for a proposed hotel to be located at 2-6 Collins Street in Hobart. The proposed development is a 14-level hotel building which includes hotel rooms, a ground floor lobby, restaurant, retail, above ground car parking, a health centre and a conference centre.

Fragrance TAS-HOBART (Collins) Pty Ltd engaged **pitt&sherry** to undertake a Traffic Impact Assessment (TIA) for the development.

This report has been prepared in accordance with the Department of State Growth's *Framework for Undertaking Traffic Impact Assessments* and details the findings of the traffic assessment undertaken for the proposed development.

## 2. Existing Conditions

### 2.1 Site Location

The site is located at 2-6 Collins Street, on the corner of Collins Street and the Brooker Highway. The site is located within the boundary of the *Sullivan's Cove Planning Scheme 1997* and has a land use classification as 1.0 – Inner City Residential. The site is currently used as a car park.

Surrounding properties include a mixture of commercial, accommodation and medium/high density residential uses. The Old Woolstore Apartment Hotel is located directly to the south-east of the site. Several medium and high density residential buildings are located to the north, west and south of the site. The theatre Royal is located to the south-west of the site along with the proposed UTAS Performing Arts School.

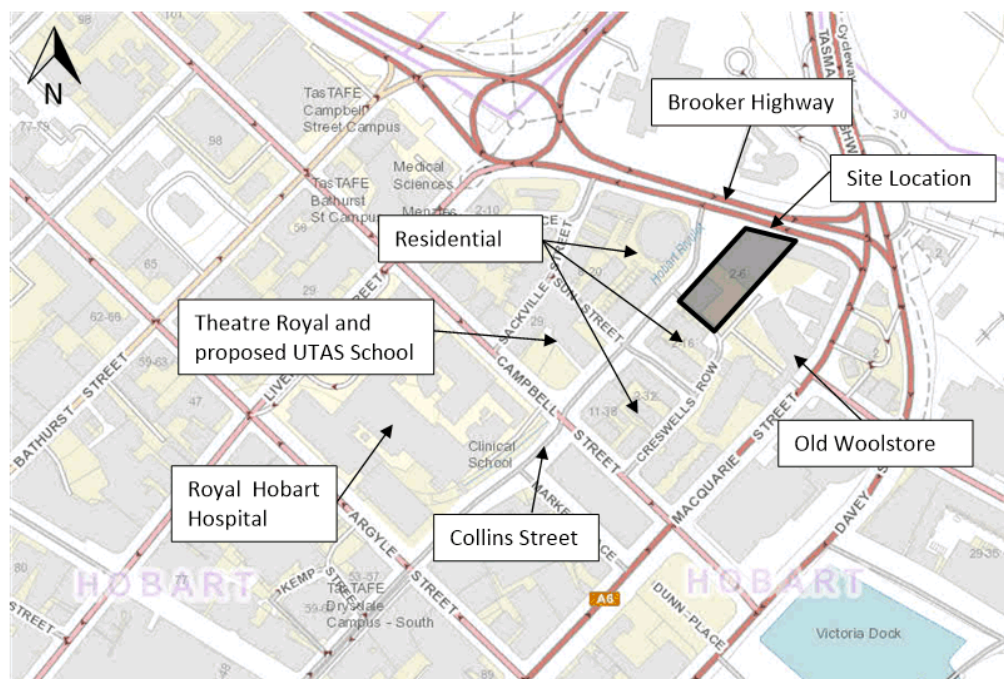

Figure 1: Site Location (Basemap source: [www.thelist.tas.gov.au](http://www.thelist.tas.gov.au))

## 2.2 Surrounding Road Network

### Collins Street

Collins Street (shown in Figure 2 and Figure 3) operates as a minor collector road and runs in a north-east/south-west direction. In the vicinity of the site it is a two-way street with one lane in each direction. Wide footpaths are located on both sides of the road, and 3hour meter parking is located along Collins Street which was observed to be about half full at the time of the site visit. Collins Street has a speed limit of 50km/h and carries approximately 3,000<sup>1</sup> vehicles per day.

Figure 2: Collins Street (facing north-east)

Figure 3: Collins Street (facing south-west)

### Brooker Highway

Brooker Highway (shown in Figure 4 and Figure 5) is a Department of State Growth Category 1 Road under the State Road Hierarchy. In the vicinity of the site it is a two-way road, running in an east-west direction, with a split carriageway and two lanes in each direction (increasing to three lanes near traffic signals). Wide footpaths are located on both sides of the road. No parking is permitted on the Highway. Brooker Highway has a speed limit of 60km/h in the vicinity of the site and carries approximately 20,000<sup>1</sup> vehicles per day in the block directly outside the side.

Figure 4: Brooker Highway (facing west)

Figure 5: Brooker Highway (facing east)

<sup>1</sup>Traffic counts undertaken in July 2016 and assuming a peak-to-daily ratio of 10%.

### Campbell Street

Campbell Street (shown in Figure 6 and Figure 7) is a major collector road and runs in a north-west/south-east direction. It is a one way street with three lanes travelling in a south-east direction. Campbell Street intersects with Collins Street approximately 130 metres south-west of the site. Campbell Street has a speed limit of 50km/h and carries approximately 10,000<sup>2</sup> vehicles per day.

Figure 6: Campbell Street (facing north-west)

Figure 7: Campbell Street (facing south-east)

### 2.3 Surrounding Intersections

The following intersections are located close to the site:

- Collins Street/Brooker Highway (sign controlled left in/left out intersection)
- Collins Street/Campbell Street (signalised intersection).

### 2.4 Traffic Volumes and Existing Intersection Operation

A traffic survey was undertaken by Matrix Traffic and transport data at the intersection of Collins Street and Brooker Highway during the following periods:

- Thursday 28 July 2016 7:30am – 9:30am
- Thursday 28 July 2016 4:00pm – 6:00pm.

SCATS data for the Collins Street/Campbell Street intersection was provided by the Department of State Growth. The data was collected in August 2016.

It was determined from the traffic data that the network AM peak hour occurs between 8:15am and 9:15am and the PM peak hour occurs between 4:30pm and 5:30pm.

The SCATS data also confirmed that the traffic volumes on weekends are significantly lower than weekday volumes.

To determine the 2018 volumes, a compound growth rate of 2% has been applied to the 2016 traffic volumes. A summary of the calculated 2018 AM and PM peak hour traffic volumes are shown in Figure 8 and Figure 9.

<sup>2</sup>Traffic Data supplied by the Department of State Growth.

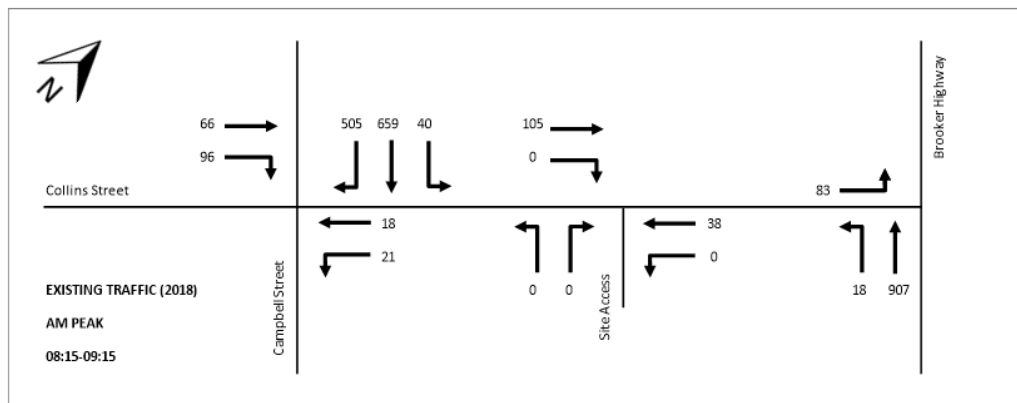

Figure 8: Traffic Volumes - Existing AM

Figure 9: Traffic Volumes - Existing PM

The traffic operation at each of the intersections has been assessed using SIDRA INTERSECTION. The intersection performance is based on the vehicle delay and the corresponding Level of Service (LOS). It is generally accepted that an intersection operates well if it is at LOS D or higher. Table 1 shows the criteria that SIDRA intersection adopts in assessing the LOS.

Table 1: SIDRA INTERSECTION Level of Service Criteria

| LOS | Delay per Vehicle (secs) |                 |                 |
|-----|--------------------------|-----------------|-----------------|
|     | Signals                  | Roundabout      | Sign Control    |
| A   | 10 or less               | 10 or less      | 10 or less      |
| B   | 10 to 20                 | 10 to 20        | 10 to 15        |
| C   | 20 to 35                 | 20 to 35        | 15 to 25        |
| D   | 35 to 55                 | 35 to 50        | 25 to 35        |
| E   | 55 to 80                 | 50 to 70        | 35 to 50        |
| F   | Greater than 80          | Greater than 70 | Greater than 50 |

It is noted that pedestrian volumes have also been considered in the SIDRA intersection modelling but would have minimal impacts on the traffic operation. The signalised intersections have been modelled to run pedestrian movements during all traffic signal phases which would be a 'worst case' scenario.

The pedestrian volumes for the unsignalised intersections have been modelled at a minimum of 50 pedestrian movements on each leg, which is significantly higher than the majority of the existing volumes; this is to allow for variations.

Table 2 presents a summary of the existing operation of the intersections, with full results presented in Appendix A.

Table 2: Existing Operating Conditions

| Intersection                       | Peak | Leg                 | Degree of Saturation (DOS) | Average Delay (secs) | 95 <sup>th</sup> Percentile Queue (m) | LOS                    |
|------------------------------------|------|---------------------|----------------------------|----------------------|---------------------------------------|------------------------|
| Collins Street/<br>Brooker Highway | AM   | South               | 0.08                       | 8                    | 2.7                                   | A                      |
|                                    |      | East                | 0.26                       | 0                    | 0.0                                   | A                      |
|                                    |      | <b>All Vehicles</b> | <b>0.26</b>                | <b>1</b>             | <b>2.7</b>                            | <b>A</b>               |

|                                    |      | North-West          | 0.48                       | 14                   | 62.4                                  | B                      |
|                                    |      | South-West          | 0.47                       | 20                   | 39.2                                  | B                      |
|                                    |      | <b>All vehicles</b> | <b>0.48</b>                | <b>15</b>            | <b>62.4</b>                           | <b>B<sup>[1]</sup></b> |

<sup>[1]</sup> The intersection has been modelled as a stand-alone intersection in SIDRA and therefore the LOS does not take into account queuing from the Macquarie Street/ Campbell Street intersection

It was observed during both peak hours that vehicles queue back in the Campbell Street left lane from the Campbell Street/Macquarie Street intersection due to the long green time given to Macquarie Street and the large number of left turners from Campbell Street into Macquarie Street.

In the majority of phases witnessed in both peak hours, vehicles waiting on Campbell Street at Macquarie Street were able to clear to allow vehicles at the Collins Street/Campbell Street intersection to move on during the current green cycle. On the few occasions that vehicles that did not clear the intersection on the first green cycle, they were easily able to clear the intersection on the second. This resulted in a delay of less than a minute.

On the basis of the above assessment it is clear that each of the intersections operate satisfactorily with acceptable queues and delays on all approaches.

## 2.5 Public Transport

Metro Tasmania operates bus services in the vicinity of the site. Campbell Street, located a 3minute walk from the site, is well serviced by buses travelling to the CBD and eastern shore with services departing frequently during peak times. The Hobart Bus Mall is located approximately 7 minutes walking distance from the site with bus services to all parts of Hobart departing frequently during peak times.

## 2.6 Pedestrian and Cycling Facilities

The site is located in a very pedestrian friendly area with pedestrian paths located on both sides of the road in the vicinity of the site. Pedestrian signals are provided at all signalised intersections in the vicinity.

There are no bicycle paths currently located on Collins Street, Brooker Highway or Campbell Street. The Hobart intercity cycleway can be accessed from Davey Street approximately 3 minutes walking distance from the site.

## 2.7 Crash History

The Department of State Growth has provided crash history information for Collins Street between Campbell Street and Brooker Avenue for the most recent five-year period. No crashes were recorded on Collins Street between the intersections. Three pedestrian-vehicle crashes and one rear-end crash were recorded at the intersection of Collins Street and Campbell Street and three left-rear crashes at the intersection of Collins Street and Brooker Avenue. Each of these crashes resulted in a minor injury or property damage only. The crash history generally represents typical crash patterns for intersections with high traffic volumes, high pedestrian volumes and low speeds.

The impact of the development on the crash risk is discussed in Section 4.6.2.

# 3. Development Proposal

## 3.1 Overview

The proposed development involves the construction of a 16-storey hotel building. The hotel building will fill the entire site. The building will have a floor area breakdown as shown in Table 3.

Table 3: Floor Area Breakdown

| Floor                     | Use  | Floor Area           | Traffic/ Parking Generating |
|---------------------------|--|----------------------|-----------------------------|
| Ground Floor<br>(Level 0) | Breakfast Restaurant and cafe                  | 392m <sup>2</sup>    | Yes                         |
|                           | Restaurant (separate tenancy)                  | 127m <sup>2</sup>    | Yes                         |
|                           | Retail   | 38m <sup>2</sup>     | Yes                         |
|                           | Business Centre                                | 18m <sup>2</sup>     | Yes                         |
|                           | Lobby, hotel lounge, back office, kitchen etc. | 1,219m <sup>2</sup>  | No                          |
| Level 1                   | Conference Centre                              | 2,302m <sup>2</sup>  | Yes                         |
| Level 1A                  | Storage and Administration                     | 816m <sup>2</sup>    | No                          |
| Level 2 – Level 4         | Car Park (167 spaces)                          | 6,655m <sup>2</sup>  | No                          |
| Level 5                   | Podium   | -                    | No                          |
| Level 6                   | Pool and Wellbeing                             | 1,428m <sup>2</sup>  | Yes                         |
| Level 7 – Level 14        | Hotel (256 rooms*)                             | 11,360m <sup>2</sup> | Yes                         |
| Level 15                  | Rooftop  | 584m <sup>2</sup>    | No                          |

\*Includes 240 1-bedroom, 8 2-bedroom, 8 3-bedroom hotel rooms

The development also involves the demolition of all existing buildings on the site and a minimum of one street tree. The proposed site plans are shown in Appendix B.

### 3.2 Vehicle Access

All vehicle access to the site will be from Collins Street.

The car park and loading and coach bays will be accessed by a driveway crossover at the south-west corner of the site. The two-way driveway is 12.2m wide in total including a 6m entry lane, a 5.2m exit lane and a 1m separation between the two lanes. A speed bump will be located in the exit lane to slow vehicles on approach to the Collins Street footpath.

It is proposed to add 2 parallel car parking spaces on Collins Street to the east of the existing parallel bus bay. It is understood that these parking spaces will not be required specifically for hotel parking as there is parking available on-site. Some of these spaces could potentially be used for short-term (less than 5-minute stopping) pick up and drop off at the hotel.

### 3.3 Footpath

A footpath will be located along the site frontage for pedestrian access. The existing footpath will be upgraded to suit the proposed development and maintain ample pedestrian access.

### 3.4 Car Parking

The proposal includes provision for 167 car parking spaces including 5 DDA spaces and 9 small car spaces.

The suitability of the car parking provision is discussed in Section 4.2.

### 3.5 Service Vehicle and Coach Parking

Service vehicles and coaches will park adjacent to the service lift. They will access the site from the two-way driveway.

The suitability of the loading and coach parking spaces are discussed in Section 4.5.

## 4. Transport Assessment

### 4.1 Vehicle Access

The vehicle access widths have been reviewed against the *Sullivan's Cove Planning Scheme 1997* and *Australian Standard for Off Street Parking (AS/NZS2890.1:2004 and AS 2890.6:2009)*. Vehicle access has been assessed for a parking facility of User Class 3, determined from Table 1.1 of AS2890.1:2004.

In order to determine the access facility category and for access driveway widths, Table 3.1 and Table 3.2 of the Australian Standard have been reviewed.

Table 3.1 shown in Figure 10 shows that a User Class 3 parking facility with 167 parking spaces can be classed as Category 3 or Category 4 depending on the frontage road. The proposed car park is accessed from Collins Street which is a local road. As such, the proposed parking facility is categorised as Category 3.

| Class of parking facility<br>(see Table 1.1) | Frontage road type | Access facility category          |           |            |            |      |
|--|--------------------|-----------------------------------|-----------|------------|------------|------|
|  |                    | Number of parking spaces (Note 1) |           |            |            |      |
|  |                    | <25                               | 25 to 100 | 101 to 300 | 301 to 600 | >600 |
| 1,1A   | Arterial           | 1                                 | 2         | 3          | 4          | 5    |
|  | Local              | 1                                 | 1         | 2          | 3          | 4    |
| 2  | Arterial           | 2                                 | 2         | 3          | 4          | 5    |
|  | Local              | 1                                 | 2         | 3          | 4          | 4    |
| 3,3A   | Arterial           | 2                                 | 3         | 4          | 4          | 5    |
|  | Local              | 1                                 | 2         | 3          | 4          | 4    |

Figure 10: Table 3.1 from Australian Standard AS2890.1:2004

| metres   |  |                       |                         |
|----------|--|-----------------------|-------------------------|
| Category | Entry width  | Exit width            | Separation of driveways |
| 1        | 3.0 to 5.5   | (Combined) (see Note) | N/A                     |
| 2        | 6.0 to 9.0   | (Combined) (see Note) | N/A                     |
| 3        | 6.0  | 4.0 to 6.0            | 1 to 3                  |
| 4        | 6.0 to 8.0   | 6.0 to 8.0            | 1 to 3                  |
| 5        | To be provided as an intersection, not an access driveway, see Clause 3.1.1. |                       |                         |

Figure 11: Table 3.2 from Australian Standard AS2890.1:2004

Table 3.2 shown in Figure 11 shows that for a Category 3 parking facility, an entry width of 6.0m and an exit width of 4.0 – 6.0m is required. A separation of 1.0m to 3.0m is required between the two driveways.

Based on the above, the 6m entry lane, 5.2m exit lane and the 1m separation between the two driveways meets the requirements of the Australian Standard.

## 4.2 Car Parking

### 4.2.1 Car Parking Requirements

The *Sullivan's Cove Planning Scheme 1997* specifies that a minimum of 3 car parking spaces per 100m<sup>2</sup> of floor area are required at the site location for all non-residential uses. Therefore, the entire hotel development would be covered by this car parking requirement.

Based on the floor areas in Table 3, the total floor area that would generate traffic to require parking is 15,665m<sup>2</sup>. This would result in the requirement for 471 car parking spaces as shown in Table 4.

Table 4: Planning Scheme Car Parking Requirement

| Floor              | Use  | Floor Area           | Parking Generating | Car Parking Requirement |
|--------------------|--|----------------------|--------------------|-------------------------|
| Ground Floor       | Breakfast Restaurant and cafe                  | 392m <sup>2</sup>    | Yes                | 12 spaces               |
|                    | Restaurant (separate tenancy)                  | 127m <sup>2</sup>    | Yes                | 4 spaces                |
|                    | Retail   | 38m <sup>2</sup>     | Yes                | 1 space                 |
|                    | Business Centre                                | 18m <sup>2</sup>     | Yes                | 1 space                 |
|                    | Lobby, hotel lounge, back office, kitchen etc. | 1,219m <sup>2</sup>  | No                 | 0 spaces                |
| Level 1            | Conference Centre                              | 2,302m <sup>2</sup>  | Yes                | 69 spaces               |
| Level 1A           | Storage and Administration                     | 816m <sup>2</sup>    | No                 | 0 spaces                |
| Level 2 – Level 4  | Car Park (167 spaces)                          | 6,655m <sup>2</sup>  | No                 | 0 spaces                |
| Level 6            | Pool and Wellbeing                             | 1,428m <sup>2</sup>  | Yes                | 43 spaces               |
| Level 7 – Level 14 | Hotel (256 rooms)                              | 11,360m <sup>2</sup> | Yes                | 341 spaces              |
| Level 15           | Rooftop  | 584m <sup>2</sup>    | No                 | 0 spaces                |
| <b>TOTAL</b>       |  |                      |                    | <b>471 spaces</b>       |

This car parking requirement is considered high for this development based on the following:

- The parking requirement for the hotel has been calculated to be 471 spaces or 1.83 spaces per room, this is significantly higher than the requirement specified in the RMS Guide to Traffic Generating Developments (2002) which specifies an indicative parking rate of 1 space per 4 bedrooms for a 3 or 4 star hotel
- Some of the floor areas would operate ancillary to each other, i.e. hotel patrons would visit the restaurant, conference centre and pool and wellbeing centre
- The development is located close to buildings that are exempt from providing parking, the development is also located approximately 200 metres from the Hobart Central Business zone which is also exempt from minimum parking requirements
- The site is located within a close distance to regular bus services, taxis are also readily available in the area
- There is good pedestrian infrastructure in place on all streets within close proximity to the site
- The majority of people accessing the development would be visitors to the hotel and to Hobart, the hotel development is located within walking distance to many major attractions including Salamanca, the waterfront and the Hobart CBD
- Tourists to Hobart have several options for transport located in close proximity including coaches which will be able to access the site, the Hop On/Hop Off bus and the airporter shuttle bus. The Mona ferry is located within walking distance as are buses and taxis
- There are several off-street car parking facilities located in the vicinity of the site which could be used to house overflow guest vehicles, many hotels use this arrangement. These car parks can also be used by the general public. On-street car parking is available on the streets surrounding the site.

Based on the above, the following assumptions have been made:

- 80% of the breakfast restaurant and café patrons would be expected to stay at the hotel resulting in 20% of the parking requirement
- 50% of the restaurant patrons would be expected to stay at the hotel
- 50% of the conference centre users, retail visitors, business centre users and pool and wellbeing users would be expected to be already staying at the hotel or within walking distance, resulting in half the parking requirement
- The hotel parking requirement has been assumed as 1 space per 4 bedrooms to align with the RMS recommendation

This results in the car parking requirement shown in Table 5.

Table 5: Revised Car Parking Requirement

| Floor              | Use  | Floor Area           | Parking Generating | Reduction  | Car Parking Requirement |
|--------------------|--|----------------------|--------------------|------------|-------------------------|
| Ground Floor       | Breakfast Restaurant                           | 334m <sup>2</sup>    | Yes                | 80%        | 3 spaces                |
|                    | Restaurant (separate tenancy)                  | 127m <sup>2</sup>    | Yes                | 50%        | 2 spaces                |
|                    | Retail   | 45m <sup>2</sup>     | Yes                | 50%        | 1 space                 |
|                    | Business Centre                                | 35m <sup>2</sup>     | Yes                | 50%        |                         |
|                    | Lobby, hotel lounge, back office, kitchen etc. | 1,420m <sup>2</sup>  | No                 | -          | 0 spaces                |
| Level 1            | Conference Centre                              | 2,296m <sup>2</sup>  | Yes                | 50%        | 35 spaces               |
| Level 2 – Level 4  | Car Park (165 spaces)                          | 6,655m <sup>2</sup>  | No                 | -          | 0 spaces                |
| Level 6            | Pool and Wellbeing                             | 1,424m <sup>2</sup>  | Yes                | 50%        | 22 spaces               |
| Level 7 – Level 14 | Hotel (256 rooms)                              | 11,360m <sup>2</sup> | Yes                | As per RMS | 85 spaces               |
| Level 22           | Rooftop  | 584m <sup>2</sup>    | No                 | -          | 0 spaces                |
| <b>TOTAL</b>       |  |                      |                    |            | <b>147 spaces</b>       |

Based on the above, the parking supply of 167 spaces is expected to be adequate for the development including ancillary activities to the hotel.

The supply of 5 DDA spaces is in excess of the requirements of the Building Code of Australia.

### 4.3 Car Park Layout Review

The car parking layout has been reviewed against the Australian Standard for Off Street Car Parking (AS/NZS2890.1:2004 and AS/NZS 2890.6:2009) User Class 3 requirements.

The requirements for car park dimensions are specified in Table 6.

Table 6: Car Parking Layout Requirements

| Feature                          | Minimum Requirement              | Proposed                         |
|----------------------------------|----------------------------------|----------------------------------|
| Parking Space Width (90 degree)  | 2.5m                             | 2.5m                             |
| Parking Space Length (90 degree) | 5.4m                             | 5.4m                             |
| Parking Space Width (parallel)   | 2.1m                             | 2.1m                             |
| Parking Space Length (parallel)  | 5.9m                             | 5.9m (7.5m between columns)      |
| Small Parking Space Width        | 2.3m                             | 2.4m                             |
| Small Parking Space Length       | 5.0m                             | 5.0m                             |
| DDA Space Width                  | 2.4m with a 2.4m shared space    | 2.5m with a 2.5m shared space    |
| Parking Aisle Width              | 5.8m                             | 5.9m                             |
| Circulation Road Width           | 5.5m (two-way)<br>3.0m (one-way) | 5.8m (two-way)<br>3.0m (one-way) |
| Circulation Road Grade           | 1 in 5                           | 1 in 5                           |

Based on the dimensions in Table 6 the proposed car park dimensions meet the requirements of the Australian Standard.

The Australian Standard requires parking spaces to have no vertical obstructions closer than 300mm in order to provide manoeuvring clearance. As such, it is recommended that parking spaces 1 and 2 on level 2 be rearranged to allow for a 300mm clearance from the building columns.

The placement of the parallel car parking spaces on level 4 is not encouraged. These spaces are located parallel to the direction of travel of vehicles exiting the car park and drivers exiting the car park would generally not be looking for a space. This arrangement could lead to drivers reversing into these spaces in the opposite direction than they were intended. However, as it is noted that there are only 2 spaces that are in this arrangement, they are not expected to have a significant impact on traffic. It is however recommended that these spaces be used for overflow parking or reserved valet parking and have a requirement to be accessed by vehicles moving down the car park.

It is recommended that a kerb or similar protection treatment is placed adjacent to each of the columns near the 2 parallel parking spaces on level 4 to ensure vehicles do not drive or reverse directly into the columns. There is sufficient space between the columns for this.

It is further recommended that bollards or a similar protection treatment be applied along the circulation roadway to protect building columns from damage by vehicles. These protective devices should be clearly visible to drivers when they are in their normal driving position.

The parallel parking spaces at 6.3m in length and 2.1m in width will be adequate on Collins Street at the site frontage in accordance with the Australian Standards.

The existing loading zone space on Collins Street outside the site will remain as requested by Council. This space is not required for the operation of the hotel which can accommodate all bus parking on site.

## 4.4 Traffic Impact Assessment

### 4.4.1 Traffic Generation

The *RMS Guide to Traffic Generating Development* does not state traffic generation rates for hotels. Therefore, the traffic generation of the hotel has been sourced from the *ITE Trip Generation Manual*. The ITE manual states a hotel as the following:

*"Hotels are places of lodging that provide sleeping accommodations and supporting facilities such as restaurants, cocktail lounges, meeting and banquet rooms or convention facilities, limited recreational facilities (pool, fitness room) and/or other retail and service shops".*

Based on that statement, the description from the ITE manual is consistent with the proposed development and therefore the ITE rate would be sufficient for determining the traffic generation.

Estimates of peak hourly traffic volumes resulting from the proposed development are set out in Table 7.

Table 7: Estimated Traffic Generation

| Use   | Size      | Design Traffic Generation Rate |                              | Traffic Generation <sup>[1]</sup> |           |
|-------|-----------|--------------------------------|------------------------------|-----------------------------------|-----------|
|       |           | AM Peak                        | PM Peak                      | AM Peak                           | PM Peak   |
| Hotel | 256 rooms | 0.67 trips per occupied room   | 0.70 trips per occupied room | 172 trips                         | 179 trips |

<sup>[1]</sup> Assuming 100% occupancy.

Table 7 indicates that the development could be expected to generate 172 and 179 vehicle movements in a weekday AM and PM peak hour respectively. This figure is expected to be conservative due to the location of the site close to the Hobart CBD, restaurants, the Hobart waterfront and Salamanca.

**pitt&sherry** is aware of the UTAS Performing Arts School development on the corner of Campbell and Collins Street. This development has not been considered in this report for traffic and car parking impacts as it is understood the development would not have any parking and students will be encouraged to travel to the site by public transport, walking and cycling.

### 4.4.2 Traffic Distribution and Assignment

#### *Directional Split*

The following directional split of traffic (i.e. the ratio between inbound and outbound traffic movements) has been adopted based on directional splits recorded in the *ITE Trip Generation Manual*:

- AM Peak 55%in/ 45% out
- PM Peak 57%in/ 43% out.

#### *Traffic Distribution and Assignment*

The distribution of traffic generated by the development is based on a number of factors including:

- The location of major traffic distributing roads around the site
- The location of traffic generating developments
- Existing traffic patterns.

Based on this, the expected traffic distribution to the study intersections is shown in Figure 12.

Figure 12: Traffic Distribution

#### 4.4.3 Traffic Impact

The traffic impacts for the post development (2018) scenario and the 10 years post development scenario (2028) have been determined. In order to represent the future growth in the area, a compounding growth rate of 2% per year has been applied to the existing traffic volumes. The growth rate has not been applied to the trips generated by the new development as it is not expected to be made larger in the future and therefore the traffic generation would not be expected to increase significantly.

It is noted that the traffic generation from the existing car park site is expected to be low and therefore was not removed from the road network. The traffic impacts would therefore represent a conservative estimate of traffic operation post development.

The post development and 10 years post development traffic volumes for each of the peak periods are shown in Figure 13 to Figure 16.

Figure 13: Traffic Volumes - Post Development (2018) AM Peak

Figure 14: Traffic Volumes - Post Development (2018) PM Peak

Figure 15: Traffic Volumes - Post Development (2028) AM Peak

Figure 16: Traffic Volumes - Post Development (2028) PM Peak

### Post Development (2018)

The impact of the hotel development on the study intersections has been assessed using SIDRA intersection. On the basis of the traffic generation rates and distributions presented above, the anticipated operation of the surrounding intersections immediately post development is summarised in Table 8. Detailed results of the SIDRA analysis are provided in Appendix C.

Table 8: Post Development (2018) Operating Conditions

| Intersection                       | Peak | Leg                 | Degree of Saturation (DOS) | Average Delay (secs) | 95 <sup>th</sup> Percentile Queue (m) | LOS                    |
|------------------------------------|------|---------------------|----------------------------|----------------------|---------------------------------------|------------------------|
| Collins Street/<br>Brooker Highway | AM   | South               | 0.12                       | 8                    | 3.9                                   | A                      |
|                                    |      | East                | 0.27                       | 0                    | 0.0                                   | A                      |

|                                    |      | South-West          | 0.13                       | 5                    | 4.8                                   | A                      |
|                                    |      | <b>All vehicles</b> | <b>0.13</b>                | <b>5</b>             | <b>4.8</b>                            | <b>A</b>               |
|                                    | PM   | South-East          | 0.08                       | 7                    | 2.1                                   | A                      |
|                                    |      | North-East          | 0.06                       | 5                    | 0.0                                   | A                      |
|                                    |      | South-West          | 0.20                       | 6                    | 8.8                                   | A                      |
|                                    |      | <b>All vehicles</b> | <b>0.20</b>                | <b>6</b>             | <b>8.8</b>                            | <b>A</b>               |

<sup>[1]</sup> The intersection has been modelled as a stand-alone intersection in SIDRA and therefore the LOS does not take into account queuing from the Macquarie Street/Campbell Street intersection

Based on the results in the Post Development Operating Conditions (2018) table, the study intersections would be expected to operate at an acceptable LOS after the hotel development.

### 10 Years Post Development (2028)

The anticipated operation of the study intersections 10 years post development is summarised in Table 9. Detailed results of the SIDRA analysis are provided in Appendix D.

Table 9: Post Development (2028) Operating Conditions

| Intersection                       | Peak | Leg                 | Degree of Saturation (DOS) | Average Delay (secs) | 95 <sup>th</sup> Percentile Queue (m) | LOS                    |
|------------------------------------|------|---------------------|----------------------------|----------------------|---------------------------------------|------------------------|
| Collins Street/<br>Brooker Highway | AM   | South               | 0.15                       | 8                    | 5.0                                   | A                      |

<sup>[1]</sup> The intersection has been modelled as a stand-alone intersection in SIDRA and therefore the LOS does not take into account queuing from the Macquarie Street/ Campbell Street intersection

Based on the results in the Post Development Operating Conditions (2028), the study intersections would be expected to continue operating at an acceptable LOS 10 years after the hotel development.

#### 4.5 Service Vehicles and Coach Parking

Swept path assessments have been undertaken for vehicle movements into the coach/ service bays. The swept paths were undertaken for the following vehicles:

- 12.5m long rigid bus – standard bus
- 8.8m delivery vehicle/minibus.

The 12.5m bus and 8.8m delivery vehicle/minibus are able to enter and exit the site in a forward direction in all directions. Large vehicles may momentarily cross the centreline when turning left into and out of the site. This is, however, not expected to have a significant impact on safety or operation of Collins Street outside the site as traffic speeds and volumes are low and sight distances are good. In addition, there is not expected to be a high volumes of large vehicles as a maximum of one 12.5m vehicle or two 8.8m vehicles could be accommodated on-site at any time.

Delivery vehicles and buses egressing the parking spaces will reverse into the path of traffic coming down the ramp from the car park above. As the reversing vehicles would be obstructed from the view of drivers coming down the ramp, a mirror should be installed at this location.

Due to the required turning space, buses can only enter the parking bay when there are no adjacent vehicles. The movements of these vehicles at different times will be managed by the hotel to ensure the coach/ service bay is empty when a bus is expected.

Swept paths for each of the vehicles are attached in Appendix E.

There is adequate space for two light vehicles entering the site to queue on-site while a large vehicle is manoeuvring into the coach/ service bays. As it is expected that manoeuvring of large vehicles into the coach/ service bays would take a short time, the two available vehicles spaces would be adequate and vehicles would not be expected to queue onto Collins Street.

#### 4.6 Road Safety

##### 4.6.1 Sight Distances

The Safe Intersection Sight Distance (SISD) at the proposed site access has been assessed against the requirements in the *Austroads Guide to Road Design – Part 4A: Unsignalised and Signalised Intersections*. The SISD has been observed from a point 5 metres back from the edge of kerb in accordance with Figure 3.2 of the Austroads Guide.

The speed limit on Collins Street at the site access is 50km/h. The SISD requirement for a 50km/h road is 90m (with a reaction time of 1.5 seconds).

The sight distance to the west of the site was observed to the intersection of Collins Street and Campbell Street, or a distance of 130m. This is well in excess of the Austroads SISD requirement.

The sight distance to the east of the site was observed to the intersection of Collins Street and Brooker Avenue or a distance of 70m. This is less than the Austroads SISD requirement at 50km/h. Considering the Collins Street and Brooker Avenue intersection is 70m away from the site access, it is not expected that a vehicle would be travelling at 50km/h as it passes the site. The SISD requirement for a 40km/h road is 67m (with a reaction time of 1.5 seconds) which is lower than the sight distance available.

Based on the assessment above, the available sight distance at the site access location is expected to be adequate.

#### 4.6.2 Crash Risk

As discussed in Section 2.7, the nearest crashes recorded in the vicinity of the proposed development were at the intersection of Collins Street and Campbell Street. These crashes were of low severity resulting in minor injuries or property damage only.

Increased pedestrian and vehicular traffic generated by the development to Collins Street and surrounding intersections is not expected to increase the severity of crashes in the vicinity. There is the potential for additional vehicular traffic to increase the risk of a low severity crash occurring between vehicles, however this is expected to be minor due to the existing high traffic volumes in the vicinity. Increased pedestrian volumes generally lead to a greater awareness of the presence of pedestrians from drivers. As such, it would not be expected that the crash risk for pedestrians would increase.

### 5. Conclusion

The proposed hotel located at 2-6 Collins Street has been assessed in accordance with the Department of State Growth's *Framework for Undertaking Traffic Impact Assessments*. The analysis and discussions presented in this report can be summarised as follows:

- The additional traffic generated by the development is not expected to have any significant impacts on the safety and operation on the surrounding road network for the post development and 10 years post development scenarios
- The development will provide a total of 167 car parking spaces, this is below the *Sullivan's Cove Planning Scheme 1997* requirement however is expected to be adequate for the development
- The entry lane width, exit lane width and separation between the exit and entry lane meets the requirements of the *Australian Standard for Off Street Car Parking AS2890.1*
- The multi-storey car park meets the requirements of the *Australian Standard for Off Street Car Parking (AS2890.1:2004 and AS2890.6:2009)*
- The coach/ service bays on the ground level are adequate for loading and unloading of delivery and passenger vehicles up to the size of a 12.5m long coach
- The new on-street car parking on Collins Street at the site frontage meets the requirements of the Australian Standards
- The existing on-street loading zone space has not been impacted by the hotel development.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Level of Service (LOS) Method: SIDRA Pedestrian LOS Method (Based on Average Delay)

Pedestrian movement LOS values are based on average delay per pedestrian movement.

Intersection LOS value for Pedestrians is based on average delay for all pedestrian movements.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akcelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Minor Road Approach LOS values are based on average delay for all vehicle movements.

NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.

SIDRA Standard Delay Model is used. Control Delay includes Geometric Delay.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Dear Cameron,  
In terms of the scale of this project the excavation for this project is relatively minor, especially as it has no basement area at all.

Essentially any excavation will only be for footings, piers and service trenching. We don't yet have detailed engineering designs for the exact footing and trenching sizes (only schematic designs), but given that the site is 3009m2 it seems unlikely this would exceed 5000m2 by any large margin.

Kind Regards,

*Chase. Wonder.*

Good morning Sam,

Although it has been some time since contact was made regarding this application, I was hoping you could confirm some information about your proposal that will assist in determining if a further external referral needs to be made.

A recent decision of the Full Court of the Supreme Court seems likely to have the implication that any proposed use and development that includes the excavation of 5000m3 or more of rock/gravel in a year is a quarry for the purposes of EMPCA. A quarry is a Level 2 Activity under EMPCA, and Level 2 Activities must be referred to the EPA board for assessment.

S group Mail - Fwd: Assessment Email - PLN-16-1133 - 2 COLLINS STREET HOBART TAS 7000

6/7/18, 9:16 am

As such I seek confirmation of how much (in m3) rock/gravel excavation is likely to be required for this proposal. If it is 5000m3 or more, then I will need to refer your application to the EPA.

If you could provide confirmation with regard to this DA that would be greatly appreciated.

If you have any questions please get back to me.

Kind Regards,

Cameron Sherriff  
Acting Senior Statutory Planner

**RE: 2-6 Collins Street – Flood Risk Assessment**

**Introduction**

Entura was engaged by Fragrance TAS\_HOBART (Collins) Pty Ltd to carry out a flood risk assessment for the proposed development at 2-6 Collins Street to address Hobart City Council's (HCC) request for information (RFI) SW1. The SW1 RFI is provided below.

**Stormwater**

**SW1** Council records indicate the site is subject to flooding from both Hobart Rivulet and Park Street Rivulet.

Please submit a Flood Risk Assessment, and associated calculations and plans, which demonstrates the development will provide a safe working and living environment for users of the site and surrounding area (including Council land and roads). This report must detail the impact of the development on flood depth, extent, velocity and duration on third-party land; as well as discuss risk to the development itself and any proposed mitigation measures. The report must include proposed floor levels, mapping comparing pre and post-development, and hazard band mapping. Flood assessment must include 1% AEP with climate change loading, however impact of the development on more frequent events should also be discussed.

This revised report addresses Hobart City Council's comments on the initial report (1 March 2018) submitted by Entura. Specifically the modelling has been updated based on revised catchment and a 20% increase in rainfall due to climate change (2100 climate) has been adopted to be consistent with recent flood study work carried out for Hobart Rivulet and New Town Rivulet. Also, as indicated by Council, presentation of 10% AEP flood results are not necessary and as such the previous modelling for this event has not been updated and 10% AEP modelling results have been removed from this report.

**Proposed development**

The site plan for the proposed development is provided in Attachment A and shows the following:

- The proposed ground floor level is 4.6m AHD.
- A ramp up from Collins Street will be provided for vehicle access and will finish at a level of 4.6m AHD.

There is no underground parking at the proposed development.

Referring to Figure 1 the development site is located at the confluence of Hobart Rivulet and Park Rivulet. Park Rivulet is fully piped with a 1.8m diameter reinforced concrete pipe (RCP) joining Hobart Rivulet. Overland flow that is in excess of the pipe capacity has the potential to affect the development site. Previous work (Entura, 2014) has identified that during large flood events Hobart Rivulet can discharge flow onto Collins Street near the Royal Hobart Hospital.

Figure 1. Location of 2-6 Collins Street and existing stormwater infrastructure and flow paths

#### **Site visit**

Entura carried out a site visit to gain understanding of the local site and overland flow paths. In the vicinity of the development locations where water could easily enter existing surrounding structures (ie driveways, laneways) was noted.

#### **Flood model**

Entura completed the latest Hobart Rivulet Flood Study in 2014. However this model did not considered overland flow along Park Rivulet. As noted in HCC request for information the development site can potentially be affected by overland flow along Park Rivulet.

A coupled hydrologic and 1D/2D hydraulic XP SWMM (Ver 2017.2) model for the Park Rivulet catchment was developed to carry out the flood risk assessment for the development in conjunction with MIKE Flood modelling results from the previous Hobart Rivulet Flood Study.

The layout of the XP SWMM model is shown in Figure 2. The following data was available to develop the model:

- Mt Wellington LiDAR over the entire catchment.
- Database of pipe locations and diameters provided by HCC. Invert levels were not available.

- ARR 2016 storms characteristics consisting of IDFs, Temporal Patterns, ARF Parameters and Interim Climate Change Factors. The data and information corresponding to the considered location are extracted from <http://data.arr-software.org>.
- Results from the previous Hobart Rivulet Flood Study (Entura, 2014) including:
  - Hydrographs of the spill from Hobart Rivulet (near the Royal Hobart Hospital). Interrogating the previous modelling results identified that the Hobart Rivulet channel capacity downstream of the spill location is approximately 30 m<sup>3</sup>/s.
  - Water levels in Hobart Rivulet at the confluence with Park Rivulet for use as tailwater levels for the Park Rivulet outfall.

The XP SWMM model was built based on the following:

- Sub-catchments were derived from LiDAR contours considering on key flow paths and were connected directly to 1D manholes in the model.
- Overland flow was modelled in 2D using a 3m grid derived from the Mt Wellington LiDAR.
- The trunk underground pipe network of Park Rivulet was coarsely modelled to enable the impact of capacity of the trunk pipe on overland flow to be considered. It was assumed that stormwater inlet pits and culverts within the overall drainage network would have the capacity to admit flow into the pipe network, up to the capacity of the pipe network. The trunk pipe alignments were based on a GIS database provided by HCC (not all manholes and pipes modelled) with manholes connected to the 2D grid to enable flow to pass between the surface and the underground pipe system. Inlet pits and their capacities were not included in the model. Pipe inverts were not available and 0.6m cover to the top of pipes was typically assumed to estimate the invert levels.
- Manholes used to define the trunk network were set to enable flow to freely pass between the pipe network and the surface.
- Manhole lid levels were based on Mt Wellington LiDAR at the location of the assumed nodes on the model.
- A fixed water level of 3.0m AHD at the Park Rivulet pipe outfall was adopted. It is not the peak water level in Hobart Rivulet for the 1% annual exceedence probability (AEP) flood event but is a reasonable representation of the water level in Hobart Rivulet over time.
- Design rainfall losses and temporal patterns from Australian Rainfall and Runoff (ARR) and design rainfall depths from the Bureau of Meteorology (BoM) were used in the hydrologic modelling.
- Apart from near the development area all buildings were modelled as a high roughness value.
- Near the site buildings were modelled as hard structures with openings at appropriate locations (ie driveways and doors) to admit water, hence considering storage volume of the floodplain near the site. Refer to Figure 3.
- For the existing case the ground level of the development site was based on Mt Wellington LiDAR and flow into the site was assumed to be blocked apart from the existing driveway entry.
- For the developed case the site was assumed to be fully raised above flood levels.
- There is a low point in the Park Creek overland flow path just upstream of Brisbane Street. This low point is captured in the 2D model terrain. A node representing a manhole was located at the invert of the low point to enable flow transfer between the surface and underground pipe

network. A sensitivity check was carried out where manholes in the low area were assumed to be blocked. There was found to be no significant impact on modelling results.

- A fixed ocean level was assumed for the downstream model boundary. The assumed level does not impact predicted water levels at the development site.
- Flood discharge from Hobart Rivulet at the Royal Hobart Hospital was taken from MIKE Flood hydraulic modelling for the Hobart Rivulet Flood Study completed by Entura in 2014. This study identified that Hobart Rivulet has a capacity of approximately  $30\text{m}^3/\text{s}$  downstream of the hospital. Flow in excess of this amount was assumed to discharge onto Collins Street. The flow from Hobart Rivulet was evenly distributed onto the 2D grid as shown in Figure 2. Refer to Appendix B
- The critical duration identified for Hobart Rivulet is 6hrs, as identified in the Hobart Rivulet Flood Study completed by Entura in 2014.
- A 20% increase in design rainfall depths was assumed for the 2100 climate scenarios. This increase was based on rainfall increases adopted for the recent Hobart Rivulet and New Town Rivulet flood studies (Entura, 2014).
- Manning's n of 0.3 for buildings and heavily urbanised areas and 0.019 for road reserves.
- Initial and continuing losses:
  - Pervious area: Initial and continuing losses of 28 mm and 3.7 mm/hr respectively
  - Impervious area: Initial and continuing losses of 0 mm and 0 mm/hr respectively

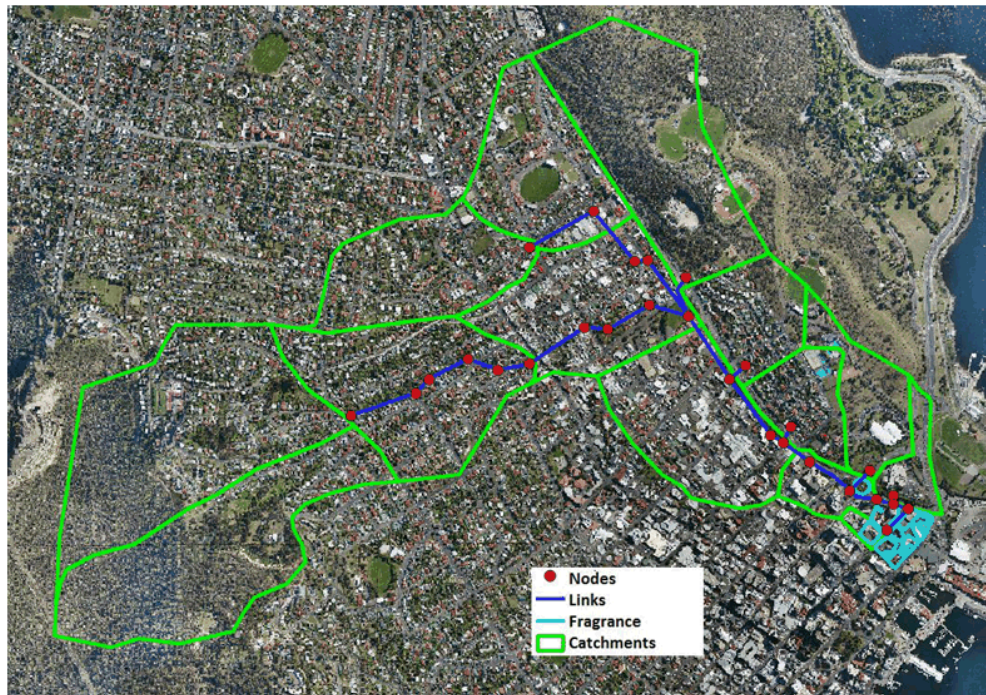

Figure 2. Model delineation including nodes (pits), links (pipes), Fragrance (proposed development) and the subcatchments

**Figure 3. Surrounding areas of the development zone (pink lines) including three check points around development zone (bluish circles: front site, side alley, and Rear site), as well as the potential spill location of Hobart Rivulet in front of Royal Hobart hospital (in dash blue line).**

#### ***Modelling scenarios***

The scenarios considered for this study are summarised below:

1. 1% AEP with/without climate change: Park Rivulet critical duration flood, existing site.
2. 1% AEP with/without climate change: Park Rivulet critical duration flood, proposed development.
3. 1% AEP with/without climate change: Hobart Rivulet critical duration flood (6hr), existing site.
4. 1% AEP with/without climate change: Hobart Rivulet critical duration flood (6hr), proposed development.

#### ***Estimation of critical duration and peak flood discharge verification for Park Rivulet***

Unlike the process documented in the previous report, it was not attempted to determine the critical duration event and critical duration temporal pattern through preliminary modelling and then run those specific scenarios through the more detailed XP-SWMM model. The full ensemble of temporal patterns were run through the XP-SWMM hydrologic/hydraulic model for the 10min to 6 hr duration storm events.

The maximum flood results (extent, level, hazard) documented in this report were based on median temporal pattern from the envelope of 10 point temporal patterns from AR&R 2016 Data Hub (<http://data.arr-software.org/>) for each duration flood.

It was found that the critical duration storm around the site varied between 10min (Brooker Avenue) and 1-2hr (Collins Street).

### **Results**

The coupled hydrologic and 1D/2D hydraulic XP SWMM model was run for the four scenarios listed above.

In summary it was identified that:

- The Park Rivulet critical duration flood event results in higher water levels in the vicinity of the development site when compared to the Hobart Rivulet critical duration event (6hr). The results presented below are based on Park Rivulet critical duration events. The flood extent/level and flood hazards maps for the Park Rivulet critical duration flood are provided in Appendix C.
- The area upstream of Brisbane Street which can store overland flow has a significant attenuation effect on overland flow.
- The critical duration flood around the upstream side of the development site (Collins Street and Brooker Ave) varies from 10 minutes in Brooker Ave (associated with local stormwater runoff from the catchment to the north) and 1hr to 2hrs in Collins Street (associated with the larger Park Rivulet catchment).
- The highest water levels adjacent to the site (for all scenarios) are in Brooker Avenue. The water levels adjacent to the existing building to the modelled 1% AEP scenarios are typically 4.2m AHD to 4.3m AHD. In Collins Street near the existing driveway the peak 1% AEP water levels are between 3.8m AHD and 3.9m AHD. All noted water levels are based on the median temporal pattern.
- The existing site is predicted to be inundated by the existing case and 2100 climate 1% AEP floods, which climate change increasing flood levels in Brooker Avenue by approximately 0.04m and in Collins Street by approximately 0.06m.
- The proposed development results in an increase in water level in Collins Street by up to 0.02 to 0.03m and was found to have no impact on water levels in Brooker Avenue. The increase in flood depth in Collins Street will be on top of flood depths of approximately 0.3m to 0.5m and therefore the increase in flooding will not have a noticeable impact on what would occur without the development in place. Flood level difference maps are provided in Appendix D.
- The highest 1% AEP predicted 2100 climate water level adjacent to the developed site is modelled to be approximately 4.31m AHD and is located at the eastern side of the development boundary on Brooker Avenue. From that location the peak water levels reduce to 4.2m AHD at the intersection of Brooker Avenue and Collins Street, and 3.92m AHD in Collins Street at the existing site driveway. The proposed floor level of 4.6m AHD is 0.29m above the highest water level and greater than 0.3m above peak water levels for the majority of the site boundary. The proposed floor level of 4.6m AHD is considered to satisfy the required freeboard criteria. It should be noted that the peak water levels in Brooker Avenue are associated with runoff from a local catchment and not directly associated with a Park Rivulet flood event.

- Flood hazard was assessed using the latest ARR guidelines. Table E.1 presents Combined Hazard Curves - Vulnerability Thresholds Classification Limits used to define flood hazard. Figures E1 to E4 present the spatial maps of maximum flood hazard in the vicinity of the site for the 1% AEP flood event.
- Flood hazard along Collins Street near the site is typically H1 or H2 (some H3) for the modelled cases. Both climate change and the proposed development result in a small but not significant increase in hazard with a greater proportion of H2 and H3.
- In the Ragged Ln adjacent to the site and behind the site flood hazard is not significantly changed due to the development.

**Conclusions**

- The proposed works will not have any significant impact on flooding in the surrounding area for the 1% AEP flood event (existing and predicted 2100 climate).
- Climate change is predicted to increase flood levels adjacent to the site in Collins Street and Brooker Avenue by up to 6cm.
- The proposed works will not have a significant impact on flood hazard for the 1% AEP flood event (existing and 2100 climate).
- Flood hazard in front of the site, including near the proposed vehicle entry/exit, for the 1% AEP 2100 climate event is low (H1 to H2).
- The proposed floor level of 4.6m AHD is 0.29m above the highest 1% AEP 2100 climate flood level (Brooker Avenue – eastern end of the site) and is typically greater than 0.3m above peak flood levels for the remainder of Brooker Avenue and Collins Street. The development is considered to satisfy the required freeboard criteria of 0.3m for the 1% AEP 2100 climate flood event.

**Recommendations**

It is recommended that during the detailed design of the proposed development a detailed drainage study should be carried out for the local catchment just to the north of the site (covering the catchment bounded by the Tasman Highway, Liverpool Street and Brooker Avenue). This detailed study should model the local drainage network in detail to confirm flow conveyance capacity of Brooker Street and identify the need, if required, for any minor drainage works for the 1% AEP flood event.

Please let me know if you have any comments or questions.

Yours sincerely

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

## **1 Introduction**

Geo-Environmental Solutions Pty. Ltd. (GES) of 29 Kirksway Place, Battery Point, Tasmania were engaged by Fragrance Group Ltd to prepare a site Contamination Management Plan (CMP) for 2 Collins St, Hobart - hereby referred to as 'The Site' (Figure 1). This document *Version 4* contains minor amendments from previous versions.

Given the level of contamination and need for an effective occupational health and safety plan, GES has recommended that a site Contamination Management Plan (CMP) is produced for the site (this document). This CMP has been prepared by a suitably qualified and experience practitioner in accordance with procedures and practices detailed in NEMP (2013) guidelines and key regulations and policies identified in the References section of this document. Personnel engaged in preparing this CMP are listed in Appendix 1 along with their relevant qualifications and years of experience.

Subject to the implementation of the requirements of the CMP, the land will be suitable for the approved used and the development will not adversely impact upon human health or the environment.

### **1.1 Background**

GES completed an Environmental Site Assessment (ESA) report for the site March 2016, which was revised in July 2018 (version 6) which included a Tier 1 Health Risk Assessment (HRA) to assess any potential soil contamination risks which may arise due to proposed site building development works.

The ESA assessed the site based on commercial land use and concluded that providing this CMP document is implemented and followed, the proposed works are acceptable and will not adversely impact upon human health or the environment.

### **1.2 Objectives**

The objective of this CMP was to comply with Hobart City Council planning requirements and the Sullivan's Cove Planning Scheme 1997. The purpose of this CMP is to identify the site hazards associated with soil contamination, minimise risks to site workers and the environment, and advise of safety measures to be adopted during and any future excavation or construction works that may occur at the site. If the principals are followed in this CMP then it is consideration of the Sullivan's Cove Planning Scheme 1997 will be met.

### **1.3 Scope of Works**

The scope of work for the CMP is to produce a guidance document that includes information in relation to identifying measures and outlining procedures to minimise human health hazards and potential environmental impacts during all phases of site works including demolition, excavation and construction and/ or post construction future trench works at the site; which include:

- Minimisation of potential adverse environmental consequences associated with exposing contaminated soils and impacting ecological receptors (the nearby marine environment);
- Minimisation of potential health risks because of exposure to potentially contaminated soil around the site during excavation and demolition works as well as during storm events where contaminants may be mobilized from surface water runoff and erosion;
- Off-site soil disposal in accordance with IB105 guidelines; and
- Outline guidelines for decommissioning underground petrol storage systems

### **1.4 Responsibility of Implementation**

It will be the responsibility of the owner(s) of the site to implement of this CMP. The owner(s) of the site may at times expressly delegate responsibility for site management as appropriate. The site owner(s) retains overall responsibility for implementation of this CMP and any modifications required should site conditions change.

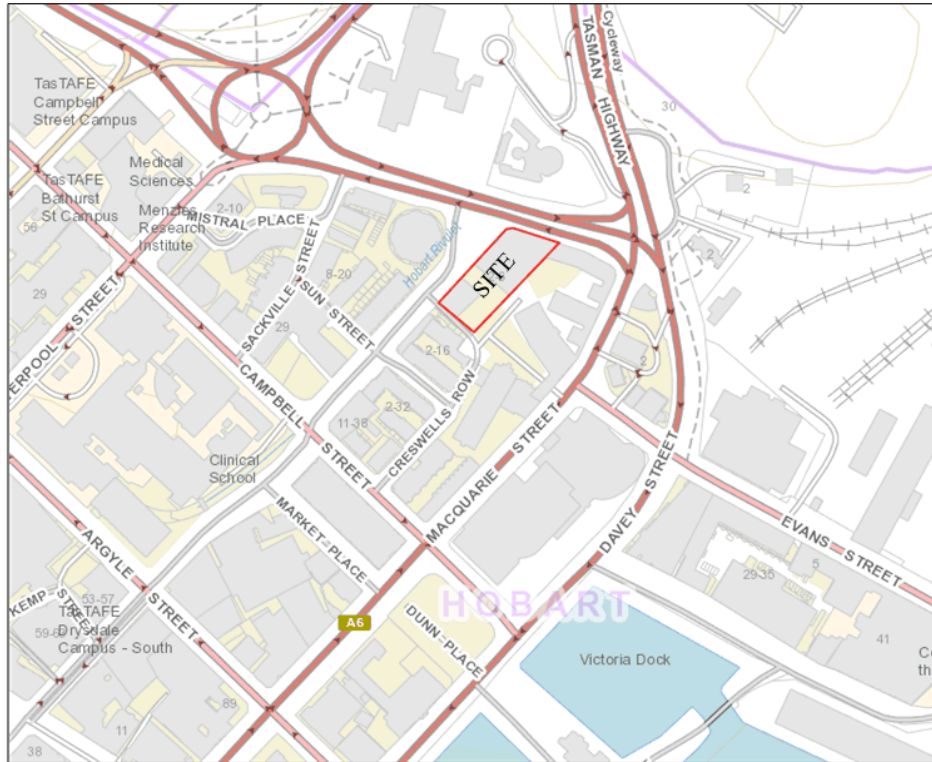

The owner(s) of the site are responsible for the distribution of this CMP to any building or development contractors working on site and these contractors must also comply with the requirements of this CMP.

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

To manage potential health risks, the advice stipulated in this CMP should be followed by all persons involved in works or other activities at the site that may result in the disturbance and/or excavation of soil within the ESA investigation areas.

### 1.5 Site Details

Site details are presented in Table 1 and the site investigation areas are presented in Figure 1 & 2.

**Figure 1-The LISTMap showing the location of the site**

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

## 2 Background Environmental Site Assessment Information

### 2.1 Soil Assessment Criteria

The reported soil analytical results were compared to the following relevant investigation guidelines suitable for assessment of soil contamination:

#### NEPM (2013) Schedule B1, Guideline on Investigation Levels for Soil.

- Health Investigation Limit (HIL D) – Commercial Land Use (assessing direct contact risk)
- Health Screening Limit (HSL D) – Commercial Land Use (assessing petroleum hydrocarbon vapour inhalation risk)
- Ecological Investigation Levels (EIL's) - have been developed for selected metal and organic substances in and commercial & industrial setting. Threshold limits are specific to select sample physical and chemical properties.
- Ecological Screening Levels (ESL's) - have been developed for organic petrochemical substances in commercial & industrial setting. Threshold limits are specific to select sample physical properties.

#### EPA Tasmania (2010) Information Bulletin 105 (IB105).

- Classification and Management of Contaminated Soil for Disposal, November 2010.

#### CRC CARE (2011)

- Health Screening Limit (HSL D) – Commercial Land Use (assessing petrochemical dermal contact risk in an industrial setting)

### 2.2 Soil Assessment Results

Soil samples were collected during borehole drilling works across the site as presented in Table 2 with locations presented in Figure 3.

**Table 2 Summary of Soil Sampling**

| Hole ID             | Soil Bore Drill & Sample |
|---------------------|--------------------------|
| TH01 to TH06 & BH07 | 15/03/16                 |
| BH08 to BH13        | 16/03/16                 |
| BH14 to BH22        | 4/08/17                  |

A total of 47 primary samples were collected from 22 locations across the site and submitted to a National Association of Testing Authorities (NATA) registered laboratory for analysis of identified contaminants of potential concern (COPC) which included the following:

- TPH/TRH;
- BTEX;
- PAHs
- Metals (15)

Please refer to Figure 4 which presents the areas of highest contamination. This figure should be used as a guide only as elevated levels of contamination may also be encountered elsewhere across the site.

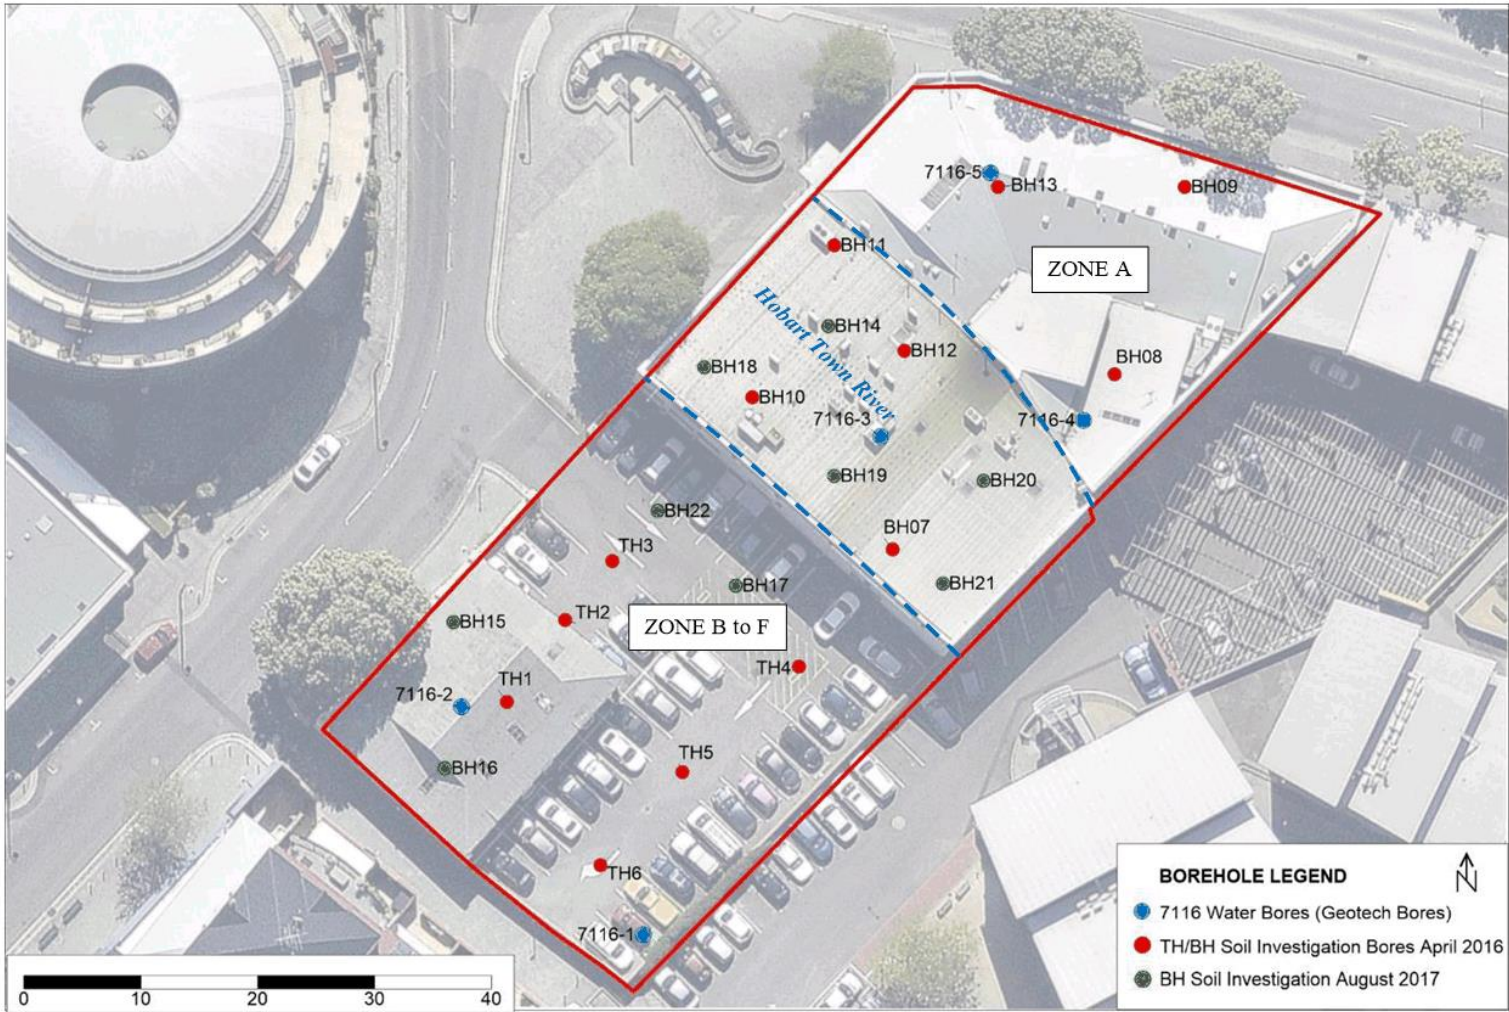

Figure 3 Borehole and Groundwater Monitoring Well locations

Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018

Figure 4 Areas of Highest Contamination in red cross hatching, monitoring wells in 7116 #s.

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

## **2.2.1 Environmental**

### **Ecological Screening Levels**

Ecological screening levels (ESL) for commercial land use were exceeded in 27 (of the 47) samples collected at various depths from TH01, TH02, TH04, BH07, BH10, to BH12, BH14, BH15 to BH21. The primary ESL contaminant of concern is benzo(a)pyrene with minor F2 and F3 exceedances. ESL exceedances are in fill across most of the site (Zones B to F) and less apparent in Zone A.

### **Ecological Investigation Levels**

Ecological investigation levels (ESL) for commercial land use were exceeded in 6 (of the 47) samples collected at various depths from TH04, BH07, & BH10 to BH12. The primary ESL contaminant of concern is zinc with minor naphthalene in BH10 which may be associated a historical kerosene or diesel spill near UST1 (Figure 2).

### **Environmental Risks**

Based on the proposed land-use and layout, the Tier 1 ESA concluded the following with respect to environmental risks:

- Zinc concentrations are deemed as acceptable in the context of the environmental setting given the common occurrence of zinc in most residential and commercial settings where there has been galvanized iron roofing and other structures, which have corroded over time; and
- Given benzo(a)pyrene is present in relatively high concentrations at the site, measures will need to be put in place to minimize likelihood of leaching into the underlying aquifer.

Once pavement is removed from the site, environmental impact of marine waters may occur because of the release of PAH's and heavy metals from leaching of contaminated fill material. Where possible, this will need to be managed as will excavated fill material to ensure that it is not washed into stormwater culverts and the marine environment.

Mitigation measures relating to the identified risks are detailed in Section 5.

## **2.2.2 Human Health**

### **Health Investigation Levels**

Health investigation levels (HIL) for commercial land use were exceeded in 6 (of the 47) samples collected at various depths from TH01, BH07, BH10 & BH18. The primary HIL contaminant of concern is benzo(a)pyrene with single lead exceedance in BH18. HIL exceedances are primarily in fill dumped on the southern embankment of historical Hobart Town River (Figure 3). An isolated occurrence (in TH01) was identified in the historical tram service/garage area (Figure 2).

### **Health Screening Levels**

There were no identified commercial land use HSL exceedances for assessing dermal contact and vapour intrusion risk to both trench workers and indoor vapour intrusion.

### **Human Health Risks**

Based on the proposed land-use and layout, the Tier 1 ESA concluded the following with respect to human health risks:

- Lead and benzo(a)pyrene impact detected in fill on the southern side of the former rivulet as well as beneath the former workshop and train service area may pose an unacceptable ingestion or dust inhalation health risk to commercial workers unless the material is suitably covered and protected from future exposure. There is a possibility this may be present in high connections at other locations across the site and general precautions are necessary for site workers.

Mitigation measures relating to the identified risks are detailed in Section 5.

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

### **2.3 Water Assessment Criteria**

Groundwater samples at the site were assessed against the following relevant investigation guidelines suitable for assessment of water contamination:

#### **Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC) 2000**

Guidelines for 90% protection of marine water ecosystems

Taswater guidelines for offsite wastewater disposal

### **2.4 Groundwater Assessment Results**

The localised receptor is expected to be Victoria Dock which is located at the exit point of the previous onsite stream. There is the possibility that groundwater may migrate towards the new Hobart Rivulet alignment.

Metal concentrations in groundwater were exceeded in groundwater collected during the March 2016 event in the following wells:

- Copper: 7116-04 & 7116-05;
- Zinc: 7116-04 & 7116-05; and
- Mercury: 7116-01 & 7116-04.

Metal concentrations in groundwater were exceeded in groundwater collected during the August 2017 event in the following wells:

- Copper: 7116-03, 7116-04 & 7116-05 which are right on the investigation limit of 0.003 ug/L;
- A single isolated occurrence of vanadium in 7116-04.

It is likely that impacted groundwater may originate from upgradient of the site.

### **2.5 Surface Water Assessment Guidelines**

Of most concern is once the pavement has been removed the potential for surface waters collecting on the site to become impacted by identified soil contamination beneath the existing pavement surface. All surface water collecting onsite needs to be treated as contaminated and a preliminary assumption needs to be made that the surface water exceeds ANZECC 2000 guidelines for 90% protection of marine water ecosystems. Until prove otherwise, the water is to be collected onsite and managed accordingly.

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

### **3 Stages of Work**

The relevant sections of the CMP should be referred to during the following phases of site work: prior to commencement demolition, excavation, construction and ongoing future trenchwork at the site.

#### **3.1 Prior to Commencement**

Contractors and workers must be made aware of the potential soil contamination and be familiar with the requirements of the CMP and they should also know that there may be environmental or human health consequences that result from noncompliance which may encore a fine from the EPA Tasmania.

Contractors must prepare one or more of the following: a site-specific Health and Safety Plan, a Job Safety Analysis (JSA) or a Safe Work Methods Statement (SWMS) covering their workers at the site for any reasonably anticipated risks.

#### **3.2 Demolition**

Demolition site work will involve the demolition of all site buildings, decommissioning redundant service infrastructure and removing all site surface coverings. Asbestos may be present in the site buildings, this is beyond the scope of the ESA or this CMP.

There will be former below ground infrastructure and associated fuel lines that require removal. See Figure 2 for the location of the underground petroleum storage systems (UPSS). Please refer to section 7 Tank Decommissioning for the details of removing the UPSS.

It should be noted that asphalt surfaces often have hydrocarbon contamination, so any asphalt surface material should be managed separately to other materials.

#### **3.3 Soil and Water Management**

A soil and water management plan should be put in place which closely aligned with aspects identified within this section of the contamination management plan.

The time between site demolition and site resurfacing (placement of the ground floor slab) is a period where there is a heightened risk of offsite spread of hydrocarbon and heavy metal impact. This period is expected to last through potentially dry and heavy rainfall events, and delays may be expected because of archeological digging. During this time there is expected to be the greatest chance of offsite spread of contaminants through leaching and soil erosion from vehicle & foot traffic, surface water riling, and dust generation.

The post demolition surface will range in elevation from 3.3 to 3.7 m AHD, with a deep depression on the eastern side of the site to ~2.7 m AHD towards the Woolstore Accommodation carpark. Much surface water at the site is expected to drain towards this point. This is particularly the case given much of the underlying surface of the site comprises of clay and there is therefore a low chance of percolation. If unmanaged, potentially impacted surface water and soil will drain into the neighboring Woolstore carpark.

This will continue to occur after the surface of the site is backfilled with aggregate, and measures introduced in the initial post demolition stage will need to continue until the site has finally been paved.

It is recommended that a drainage sump is placed at the site to collect surface water. The best location for this sump may be the lower lying section of the site on the eastern boundary. Perimeter drains should be set up to divert water into the sump and the prevent offsite discharge of impacted water. The sump should have additional pumps set up as backup which discharge water into onsite holding tanks of adequate size to allow for survivability (cartage) after a heavy downpour.

The sump should remain in place following placement of fill given surface water will continue to percolate and discharge into the sump and towards the neighboring site. The sump can be finally decommissioned following surfacing of the site.

It is highly recommended that bitumen removal occurs at the last stage of site demolition (following all excavation works). This will allow a hardstand area for vehicles to park which will reduce offsite spread of contaminants.

Open site drains should be converted to French drains with ag piping and geotextile (if not already done) and the sump should remain active until slab formwork is ready to be installed.

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

In summary, rainfall events may cause a spike in site contaminant concentration in surface waters passing over the site. This may be managed by:

- Appropriate personal protective equipment and processes are required when handling potentially contaminated water.
- limiting the exposure of paved surfaces through keeping pavement in place for as long as possible.
- Limiting the length of time, the service trenches and footing trenches remain open;
- Careful management of the site topsoil to reduce the risk of soil erosion and overland movement of impacted soil and water into drainage systems.
- Placing cutoff drains around the perimeter of the site and collecting all runoff into a suitably sized sump.
- Water that is encountered at the site, through pumping or extracting and is required to be removed needs to be contained at the site so as not to cause environmental harm.
- Sump pumps (of suitable size) should be used to discharge sump water into dedicated holding tanks of suitable size provided by a registered waste contractor which fit with the collection schedule and site stormwater flow calculations;
- Off-site disposal of wastewater must be conducted in accordance with the Environmental Management and Pollution Control (Waste Management) Regulations, 2000 and local Water Authority (TasWater) requirements.
- Testing and assessment of the quality of the extracted water must be conducted prior to disposal. A suitably qualified environmental consultant should conduct sampling and analysis to advise on appropriate management options.
- Sump water should be analysed immediately following minor rainfall events rather than risking full tanks before testing. As a guide, a testing turnaround time of 3 days is typical during working days (5 days either side of a weekend).
- Dependent on the results of analysis the liquid waste will typically be disposed to a licensed waste treatment facility
- Alternatively, the water must be transported to an approved facility for offsite remediation by a Controlled Waste Handler approved by EPA Tasmania.

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

### **3.4 Excavation**

The proposed final floor level will be at 4.60m AHD which is approximately 1m above the current site level and approximately 1m of fill be required, give or take, across the entire site. Excavations are expected to be minimal and will be required for services, the building footings and lift wells only. Appropriate soil disposal associated with the development will be required. Excavation works as part of the development is anticipated to include:

- Levelling of the site;
- Installation of underground infrastructure such as pipes for water/ storm water and cables for electricity;
- Excavations/ drilling for the new buildings deep footings; and
- Shallow excavations for the cavity for the six lift wells and stair cases.

During excavation work, soil from the site must be managed so as not to cause environmental harm in accordance with the Environmental Management and Pollution Control (Waste Management) Regulations, 2000 and the Environmental Management and Pollution Control Act (EMPCA, 1994). Harm can be caused from contaminated soils leaching further underground, leaving the site through wind (as dust) or carried off site with rain (as runoff storm water). See Section 4 for the Minimisation of Potential Environmental Impacts. Although the management of excavated material will be limited, the following should be considered when managing soil at the site:

- It must be managed vertically as well as area specific due to surface and localised areas of contamination across the site. *It is noted that soil in the upper 1 m of the site should be considered contaminated. It is advised that this upper metre excavated out of boreholes or excavations is not mixed with soil or rock from a greater depth at this will likely contaminate all material, and subsequently all material may need to be transported offsite to a licenced facility. Surface metre of soil should be stockpiled separately.*
- If stockpiled for greater than 12 hours should be covered with an impermeable layer (eg. PVC plastic 2mm thick) to prevent the contents being affected by wind or rain;
- Soil which will excavated and removed from the site for landfill disposal is to be assessed by an Environmental Consultant and results compared against Information Bulletin 105 (IB105) for Classification and Management of Contaminated Soil for Disposal. See Section 6 IB 105.
- It is not necessary for the soil that remains on site to be classified against IB 105.

### **3.5 Construction**

If there are any changes to the plans during the construction phase and additional excavations are required, the CMP should be revisited.

### **3.6 Future Trench Work**

It is anticipated that over time future trench workers/ contractors will visit the site from time to time as services require repairs or new infrastructure is required. These trench workers/ contractors should be made aware of the potential contamination that may be encountered at the site and should be provided with a copy of this document.

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

## **4 Minimisation of Potential Environmental Impacts**

The potential adverse environmental consequences associated with exposing contaminated soils and impacting ecological receptors (the nearby marine environment) includes:

- Leaching of metals and PAHs from contaminated soils into groundwater; and/ or
- The movement of contaminated soil into the stormwater system.

To minimise potential migration of contaminants into the marine environment, all work carried out prior to, during and following the completion of any soil excavation, must be conducted in accordance with the guidance set out in this plan as well as all relevant EPA Tasmania guidelines.

### **4.1 During Excavation Works**

During excavation works excavated soil must be:

- Managed vertically as well as specific areas due to surface and localised areas of contamination across the site, see Figure 4.
- If stockpiled for greater than 12 hours should be covered with an impermeable layer (eg. PVC plastic 2mm thick) to prevent the contents being affected by wind or rain;
- If soil is going to be removed from site is to be assessed and sampled by an Environmental Consultant and results compared against *Information Bulletin 105 (IB105) for Classification and Management of Contaminated Soil for Disposal*.

It is not necessary for the soil that remains on site to be classified against IB 105.

### **4.2 Stormwater Management and Sediment Control**

To prevent contaminated soil leaving the site and potentially contaminating groundwater and storm water the following measures should be followed:

- Install drainage and/or grade soil surfaces to minimise pooling of water on exposed soils.
- Place sediment control devices around storm water drains and stockpiles as required.
- Ensure vehicles and equipment are free from excess soil when leaving the site, to avoid tracking soil off-site.
- Establish an equipment wash down area if necessary.
- Keep stockpiles covered and sealed at all times possible
- Avoid extended stockpiling of soil.
- Clean up any soil spilt on roads adjoining the site.
- Avoid conducting vehicle or machinery maintenance on-site.
- Ensure any fuel, oil or other chemicals are stored safely and securely and are prevented from leaking.
- Repair or remove any leaking containers or machinery from the site.
- Clean up any spilt fuel, oil or other chemicals as soon as possible.
- Check sediment control measures regularly (at least daily) and clean and maintain as necessary.
- Inspect sediment control measures more frequently during rain periods, to check they are adequate for site conditions.

### **4.3 Dust Control for Environmental Protection**

Generation of dust can spread contaminated soil causing environmental harm or create a nuisance to neighbouring residents causing adverse health effects. Measures that can be undertaken to assist in minimising the generation of dust which will minimise the amount of soil leaving the site include:

- Minimise movement of equipment on the site.
- Minimise excavation and movement of soils.
- Use a water spray to dampen work areas sparingly if excess dust is generated.
- Use a water spray sparingly to dampen soil prior to and during excavation if excess dust is generated.
- Avoid soil excavations that create dust on windy days.
- Keep soil stockpiles covered at all times possible, with an impermeable membrane (eg. plastic sheeting) to minimise generation of dust and to limit runoff of sediment.

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

- Avoid extended stockpiling of soil.
- Consider the use of dust barriers such as hessian or cloth screening.

#### **4.4 Surface Covering**

An impermeable barrier can act as physical cap that ensures onsite soil contamination does not come in contact with ecosystem receptors and/ or human receptors. Physical separation layers are applicable to areas where there is soil excavation and/or surface cover disturbance at the site which includes infilling and stockpiling. In the areas of the site not covered by a permanent hardstand surface (such as bitumen, concrete or building slabs) capping measures for the various landscaping finishes are required to prevent contact with the underlying soil as a precautionary measure. Some relevant examples of suitable capping layers are described in Table 3 below. These options may also be used as a short term solution.

**Table 3 Examples of Capping Layers**

| <b>Surface Landscape Type</b> | <b>Area/Land Use</b>          | <b>Characteristic</b> | <b>Capping Requirements</b>   |
|-------------------------------|-------------------------------|-----------------------|---|
| Concrete                      | Footpaths and high wear areas | High traffic areas    | Suitable in a range of areas due to the ability to provide a level surface. Provides effective barrier to underlying soils and is not likely to leach contaminants. |
| Bitumen                       | Access roads                  | High traffic areas    | Keep existing bitumen surfaces if possible. Newly reinstated bitumen in accordance with roads standards.  |

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

## **5 Minimisation of Potential Health Risks**

### **5.1 Human Health Exposure Routes**

Potential health exposure risks during any excavations or subsurface works may be associated with soil excavation and management, movement of soil around the site and/ or storm water management and sedimentation. Onsite exposure pathways include dermal contact, ingestion of contaminated soil and surface water and inhalation of dust. The most likely hazard scenario for offsite human receptors include dust inhalation and soil ingestion.

A soil and water management plan will need to be put in place to minimize offsite erosion and drainage of hydrocarbon and heavy metal impacted surface water. Offsite residential receptors have a higher exposure risk compared with onsite commercial receptors.

To minimise potential human health risks, all work must be conducted in accordance with the guidance set out in this plan as well as any relevant EPA Tasmania guidelines.

Work procedures conducted on the site must be in accordance with relevant Occupational Health and Safety (OH&S) Regulations. It is the responsibility of the principal contractor that site workers are made aware of the OH&S issues at the site.

Engaged companies/contractors must prepare one or more of the following a site-specific Health and Safety Plan, a job safety analysis (JSA) or a safe work methods statement (SWMS) covering their workers at the site for any anticipated risks.

### **5.2 Mandatory Site Inductions**

The principal contractor must ensure that site workers and visitors are provided with:

- Site safety induction briefing.
- Adequate hand washing facilities.
- A designated clean area for storage and consumption of food and drink.

Personnel working at or visiting the site during site redevelopment, including demolition, excavation, construction and future trench work, must be provided with an induction briefing, based on the example *Site Induction Record* provided in Appendix 2. This induction record may be incorporated into the general site induction procedure if the site operator does not have their own or if it does not sufficiently cover the issue of contamination management. The principal contractor may delegate responsibility for the induction briefing to environmental consultants

#### **5.2.1 Limiting Soil Contamination Exposure**

Measures that must be undertaken to manage exposure of site workers to contaminated soil include:

- Avoid handling of potentially contaminated soil and/or water.
- Wash hands before eating, drinking or smoking.
- Avoid activities that may introduce soil and/or water to the mouth, such as nail biting.
- Remove soiled clothing and footwear before entering a designated clean area and before leaving the site.
- Use personal protective equipment (PPE) as required. In addition to hard hats, safety boots, safety glasses and hearing protection, this equipment may include:
  - Gloves;
  - Long sleeved shirt and long trousers; and
  - As applicable dust masks.

#### **5.2.2 Limiting Dust Exposure**

Generation of dust can spread contaminated soil and pose a risk to human health risk onsite and offsite. Measures that can be undertaken to assist in minimising the generation of dust and limit the amount of soil leaving the site include:

- Minimise movement of equipment on the site.
- Minimise excavation and movement of soils.
- Use a water spray sparingly to dampen work areas if excess dust is generated.

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

- Use a water spray sparingly to dampen soil prior to and during excavation if excess dust is generated.
- Avoid soil excavations that create dust on windy days.
- Keep soil stockpiles covered at all times possible, with an impermeable membrane (eg. plastic sheeting) to minimise generation of dust and to limit runoff of sediment.
- Avoid extended stockpiling of soil.
- Consider the use of dust barriers such as hessian or cloth screening.

### 5.2.3 Surface Covering

An impermeable barrier can act as physical cap that ensures onsite users and offsite users do not meet potentially contaminated soil. All soil stockpiles should be covered, and any discernable offsite soil erosion should similarly be covered. Refer to Section 4.4 Surface Covering for details.

### 5.2.4 Monitoring Soil Gas Exposure

Measures that must be undertaken to manage exposure of site workers (during excavation, construction and future trench workers) to soil gas contaminants include:

- Anecdotal evidence suggest that cyanide gasses as well as petroleum hydrocarbons may be present at the site.
- Standard OS&S procedures should be followed for working in confined spaces; and
- Personal gas monitoring devices such as an LEL meter should be used prior to and at all times while in confined spaces.

## 6 IB 105 Guidelines

Given the historical use of the site and variation in soil classification and contamination across the site, GES recommends that all soil excavated at the site is stockpiled systematically, tested for contamination levels and transported to a licensed storage and handling facility for managing contaminated soil.

Soil flagged for landfill disposal is to be assessed by an Environmental Consultant and results compared against *Information Bulletin 105 (IB105) for Classification and Management of Contaminated Soil for Disposal*.

See Appendix 3 for the comparison of soil analytical results from the ESA against IB105 plus IB105 in full. It is anticipated heavy metal and PAH contamination will be encountered across the site.

Crushed rock should be kept separate to the fill material, this will minimise disposal costs of contaminated material.

## 7 Tank Decommissioning

The following should be undertaken during the process of Underground Tank decommissioning and removal:

- A suitable qualified and experience contractor should be engaged to the remove the Underground Petroleum Storage Systems (UPSS) and/ or underground storage tanks (USTs) and the Environmental Consultant should be onsite during the excavation to observe the material that is being removed from each tank pit, sample and document to produce a site validation report.
- The storage system must be removed and disposed of in accordance with *Australian Standard AS 4976 The removal and disposal of underground petroleum storage tanks (AS4976)*.
- The decommissioning of UPSS and USTs must be done in accordance with the EPA Tasmania Technical Guideline UPSS2 *'Underground Petroleum Storage Systems: Decommissioning Assessment – Sampling and Risk Assessment Guidelines*. A copy of these guidelines should be followed by the environmental consultant and communicated with staff on the ground.
- A *UPSS Decommissioned UPSS Form* must be completed and submitted to the EPA Tasmania once the tank has been removed.
- The validation report must be produced in accordance with EPA Tasmania Technical Guideline UPSS1 *'Underground Petroleum Storage Systems: Decommissioning Assessment – Report*

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

*Requirements*'. This document must be submitted to the EPA Tasmania within 4 months of removal.

At a minimum the following procedures should be followed during the tank decommissioning:

- Photographs documenting the tank removals should be taken.
- The removed tanks and infrastructure should be inspected for leaks.
- The tank pit should be open for as little time possible and covered with plastic while open overnight with suitable OH&S barriers.
- Tank pit walls and base plus any groundwater in the excavation should be screened and sampled by the environmental consultant.
- No soil or groundwater derived from the tank pit is to be removed from site from the unless inspected, screened and sampled by Environmental consultant.
- Hot works should not be conducted near the tank pits while removal is taking place or while the hole remains open.

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

## 8 SUMMARY OF ROLES AND RESPONSIBILITY

|  |   |
|--|---|
| Site Owner                             | <p>The owner(s) of the site are responsible for the distribution of this CMP to any building or development contractors working on site and these contractors must also comply with the requirements of this CMP.</p> <p>There is a responsibility to ensure a soil and water management plan (SWMP) is put in place prior to site demolition works, and the plan is active as soon as site coverings are removed. The SWMP should not be removed until site ground floor slab formwork is being prepared.</p> <p>Post the site redevelopment, the site owner(s), who may delegate to a site operator is responsible and must inform future site contractors and trench workers of the CMP and the requirements to follow its contents.</p>   |
| Site Manager during site redevelopment | <p>Responsible for the preliminary assessment of potential contamination discovered and assessing whether further action is required. The Site Manager is responsible for ensuring the induction of Site Operatives, assessing the adequacy of quarantine measures and contacting the relevant Consultant and/or Contractors where appropriate. Potential offsite migration of surface water and soil needs to be assessed during and after rain events.</p> <p>Once an area is declared free of the contamination, the Site Manager's role will be to remove the quarantine and allow site works to proceed</p>  |
| Site Operatives                        | <p>During the works, the Site Operative will be vigilant for potential contamination. Where potential contamination is identified, Site Operatives will quarantine the area and inform the Site Manager. An Environmental Consultant may be required to assess the site. Potential offsite migration of surface water and soil needs to be assessed during and after rain events.</p>   |
| Environmental Consultant               | <p>If the services of an Environmental Consultant is required, (as they will be for the tank pit sampling and validation report writing) they will be responsible for assessing the potential contamination find, undertaking any necessary sampling and delineation, if required, developing a remedial scope and validating remediation to render the site suitable for residential development.</p> <p>The Environmental Consultant must have appropriate qualifications and expertise in environmental assessment (e.g. an experienced environmental scientist, environmental soil scientist, environmental geologist or environmental engineer). All findings and conclusions will be reported, as appropriate, to the satisfaction of the Site Manager and the Site Owner</p> |

*Contamination Management Plan – Version 4 – 2 Collins St, Hobart. 3 July 2018*

## **LIMITATIONS STATEMENT**

This Contamination Management Plan has been prepared in accordance with the scope of services between Geo-Environmental Solutions Pty. Ltd. (GES) and Fragrance TAS – HOBART (Collins) Pty Ltd ('the Client'). To the best of GES's knowledge, the information presented herein represents the Client's requirements at the time of printing of the Report. However, the passage of time, manifestation of latent conditions or impacts of future events may result in findings differing from that described in this Report. In preparing this Report, GES has relied upon data, surveys, analyses, designs, plans and other information provided by the Client and other individuals and organisations referenced herein. Except as otherwise stated in this Report, GES has not verified the accuracy or completeness of such data, surveys, analyses, designs, plans and other information.

The scope of this study does not allow for the review of every possible soil and groundwater contaminant over the whole area of the site. The conclusions described within this report are based on these samples, the results of their analysis from the Environmental Site Assessment by GES (June, 2018) and an assessment of their contamination status.

This report does not purport to provide legal advice. Readers of the report should engage professional legal practitioners for this purpose as required.

No responsibility is accepted for use of any part of this report in any other context or for any other purpose by third party.

## GES STAFF ENGAGED IN CMP REPORTING

**APPENDIX 1 GES STAFF**

Geo-Environmental Solutions (GES) is a specialist geotechnical and environmental consultancy providing advice on all aspects of soils, geology, hydrology, and soil and groundwater contamination across a diverse range of industries.

Geo Environmental Solutions Pty Ltd:

- ACN – 115 004 834
- ABN – 24 115 004 834

**GES STAFF - ENGAGED IN SITE INVESTIGATION WORKS**

*Dr John Paul Cumming B.Agr.Sc (Hons) Phd CPSS GAICD*

- Principle Author and Principle Environmental Consultant
- PhD in Environmental Soil Chemistry from the University of Tasmania in 2007
- 12 years' experience in environmental contamination assessment and site remediation.

*Mr Kris Taylor Bsc (Hons)*

- Senior Environmental & Engineering Geologist
- Honours in Environmental Geology at the University of Tasmania in 1998
- 15 years' experience in environmental contamination assessments and hydrogeology (including honours in mine site tailing pollution assessment)

*Ms Sarah Joyce BSc (Hons)*

- Senior Environmental Scientist
- Honours in Geography and Environmental Science at the University of Tasmania in 2003;
- Undergraduate Degree Double Major in Geology and Geography & Environmental Science
- 15 years professional work experience and six years contaminated site assessment

*Mr Grant McDonald (Adv. cert. hort.)*

- Soil Technician
- 6 years' experience in hydrocarbon and heavy metal contamination sampling of soils and groundwater.

*Mr Aaron Plummer (Cert. IV)*

- Soil Technician
- 3 years' experience in hydrocarbon and heavy metal contamination sampling of soils and groundwater.

**GES STAFF – CONTAMINATED SITES EXPERIENCE**

*Mr Sam Rees B.Agr.Sc (Phd)*

- Soil & Environmental Scientist
- 6 years' experience in hydrocarbon and heavy metal contamination assessment and reporting of soils and groundwater.

*Mr Mark Downie B.Agr.Sc (Hons)*

- Soil Scientist
- 3 Year experience in contamination assessment and reporting of soils and groundwater.

*Mr Matthew Temlett*

- Engineering Geologist
- Masters in Applied Environmental Geology
- 10 years working as an Engineer and two years experience in contaminated sites; soil, groundwater and conceptual site models.

## SITE INDUCTION

**APPENDIX 2 Site Induction Form****2 Collins St, Hobart, Tasmania**

I ..... of ..... have  
been inducted to 2 Collins Street St, Hobart, Tasmania and have been informed of the CMP and  
its contents on .....(date)

I have been informed of the contents of the CMP and the responsibilities I have in ensuring that the  
CMP is adhered to relating to the following issues:

- Understanding the site contamination status
- Understanding the potential health impacts for site workers associated with site contamination
- Understanding the potential environmental impacts associated with site contamination
- Understanding how to reduce the risks to human health and the environment
- Maintaining documentation related to upholding the CMP

**SOIL MANAGEMENT**

- Excavation and stockpiling of soil at the site
- Movement of soil around the site
- Off-site disposal of soil
- Import of fill to the site
- Dust control

**WATER MANAGEMENT**

- • Stormwater management and sediment control

I HEREBY ACCEPT THESE RESPONSIBILITIES.

NAME: .....COMPANY:.....

SIGNED .....DATE .....

INDUCTED BY: .....DATE .....

IB105

## APPENDIX 3 IB 105

IB105 is on the next page. The soil samples have been compared against IB105 guidelines for soil disposal, refer to Table 4. The following conclusions have been made;

- Exceedances of barium, cadmium, copper, lead, manganese, mercury and zinc have been detected up to Level 2 however when these metal concentrations are averaged the soil is reduced to level 1 classification.
- Exceedances of lead have been detected up to Level 3 however when these metal concentrations are averaged the soil is reduced to level 1 classification.
- Exceedances of B(a)p, and the Sum of PAHs have been detected up to Level 4 however when these analyte concentrations are averaged the soil is reduced to level 3 classification.
- Exceedances of TRH ( $C^{10}-C^{36}$ ) have been detected to Level 3 however when these metal concentrations are averaged the soil is reduced to level 2 classification.

**Table 4 Soil Analytical Results Compared Against IB105 Investigation Limits for soil Disposal, March 2016 and August 2017**

IB105

Information Bulletin No. 105

Classification and Management of Contaminated Soil for Disposal

Level 6, 134 Macquarie Street, Hobart TAS  
GPO Box 1550, Hobart, TAS 7001 Australia**INFORMATION BULLETIN No. 105***Environmental Management and Pollution Control (Waste Management) Regulations 2010*

**CLASSIFICATION AND MANAGEMENT OF CONTAMINATED  
SOIL FOR DISPOSAL  
November 2012**

**1. Introduction**

This bulletin defines the criteria used by the Environment Protection Authority (EPA) for the classification of contaminated soil that requires treatment and/or off-site disposal, and outlines the management of each classification in accordance with the *Environmental Management and Pollution Control (Waste Management) Regulations 2010* (the 'Regulations'). Although criteria set out in this bulletin have been determined for soil, they may be applicable to the classification of other solid waste material on an 'as needs basis' (see section 2.2.3). Please note, for the purposes of this Bulletin soil also includes dredge spoil (refer Section 2.2.5).

This bulletin is designed to be used by waste producers, consultants, local government, waste transporters and landfill operators that are responsible for determining whether potentially contaminated soil is suitable to be disposed of at a landfill, in assessing alternative options for contaminated soil management and how to make an application for disposal approval to the EPA.

The EPA encourages effective waste management by promoting on-site remediation, treatment and/or re-use, where appropriate, as the preferred options for dealing with contaminated soil. In accordance with the hierarchy of waste management options, direct disposal of soil to landfills should be used only when no other approved method of dealing with the contaminated soil is available. For further details on these waste management principles, see Section 1.2 of the *Landfill Sustainability Guide 2004* (DPIWE, 2004).

Treatment, re-use options and disposal of soil will be assessed and approved on a case by case basis by the Director, EPA ('the Director') or the Director's delegate.

**2. Classification**

The EPA uses 4 categories to classify contaminated soil: (Level 1) *Fill Material*; (Level 2) *Low Level Contaminated Soil*; (Level 3) *Contaminated Soil*; and (Level 4) *Contaminated Soil for Remediation*, Table 1 below summarises each classification.

Criteria in Table 2 below shows the maximum total concentration, and the maximum leachable concentration values for specific pollutants that are used to classify soil for off-site disposal. For soils classified as potentially acid sulfate soils (PASS), the criteria in Table 2 do not apply. Determination of risk associated with these soils should be conducted in line with the *Tasmanian Acid Sulfate Soil Management Guidelines* published by Department of Primary Industries, Parks, Water and Environment (refer Section 2.2.5).

Potentially contaminated soils are classified by analysis of representative samples of the soil and comparison of the results to the chemical concentrations given in Table 2.

Revised November 2012

IB105

Information Bulletin No. 105

Classification and Management of Contaminated Soil for Disposal

It is not necessary to sample for all contaminants listed in Table 2 for soil classification. However, all contaminants that are reasonably likely to be present in the soil above background levels should be included in the sample analysis.

Generally, where a leachable concentration is prescribed in Table 2 that value takes precedence over the total concentration and is used as the sole determinant of final classification for disposal (see section 2.2.4 for further information).

Please note that these values in Table 2 are **not** to be interpreted as clean up target levels for certain land uses.

**Table 1.** Summary of the classification process

|  | <b>Classification</b><br>(with reference to Table 2)   | <b>Controlled<br/>Waste<sup>1</sup></b> | <b>Comments</b>  |
|--|--|---|--|
| <b>Fill Material<sup>2</sup></b><br><b>(Level 1)</b>         | Soil that exhibits levels of contaminants below the limits defined under <i>Fill Material</i> in Table 2.  | Unlikely                                | Soil classified as <i>Fill Material</i> can still be a 'pollutant' under the <i>Environmental Management and Pollution Control Act 1994</i> and needs to be responsibly managed.   |
| <b>Low Level Contaminated Soil</b><br><b>(Level 2)</b>       | Soil that exhibits levels of contaminants above the limits defined under <i>Fill Material</i> but below the limits defined under <i>Low Level Contaminated Soil</i> in Table 2.  | Likely                                  | Where leachable concentrations have not been prescribed, maximum total concentrations will be used to classify the soil.   |
| <b>Contaminated Soil</b><br><b>(Level 3)</b>                 | Soil that exhibits levels of contaminants above the limits defined under <i>Low Level Contaminated Soil</i> but below the limits defined under <i>Contaminated Soil</i> in Table 2.  | Yes                                     | Where leachable concentrations have not been prescribed, maximum total concentrations will be used to classify the soil.   |
| <b>Contaminated Soil for Remediation</b><br><b>(Level 4)</b> | Soil that exhibits levels of contaminants above the limits defined under <i>Contaminated Soil</i> in Table 2 (regardless of the maximum total concentrations) is generally <b>not</b> considered acceptable for off-site disposal without prior treatment. | Yes                                     | Soil that contains contaminants that do not have criteria for leachable concentrations (e.g. petroleum hydrocarbons), and the levels of contaminants exceed the maximum total concentrations listed in <i>Contaminated Soil</i> , are generally classified as <i>Contaminated Soil for Remediation</i> . |

<sup>1</sup> Controlled Waste is defined in the *Environmental Management and Pollution Control Act 1994*.

<sup>2</sup> Criteria for *Fill Material* are the limits set by the Director for the purposes of R.9(2)(a)(ii) in the *Regulations*.

IB105

Information Bulletin No.105

Classification and Management of Contaminated Soil for Disposal

**2.1 Controlled waste**

Contaminated soil may or may not be a controlled waste as defined in the *National Environment Protection Measure for the Movement of Controlled Waste between States and Territories* (NEPC, 1998) and the *Environmental Management and Pollution Control Act 1994* (EMPCA) and as further prescribed in the Regulations.

Soil and other material reasonably suspected to be a controlled waste must be sampled and analysed to determine whether it is a controlled waste before that waste can be removed from the site (R.6(3) of the Regulations). This generally includes, but is not limited to soil that is from a site that is used, or has been used, for an activity listed in Table 3 and is likely to be contaminated.

Special provisions apply to the management of controlled waste, as detailed in section 3 of this bulletin. As a general rule all *Low Level Contaminated Soil*, *Contaminated Soil* and *Contaminated Soil for Remediation* that is intended for treatment, re-use or disposal should be managed as controlled waste unless sampling proves otherwise.

**2.2 Sampling and analysis**

The waste producer is responsible for organising the sampling and analysis of potentially contaminated soil. It is recommended that a suitably qualified person perform all sampling. Additionally, all soil sampling should be conducted in accordance with the relevant Australian Standards, which include:

- AS 4482.1-2005 Guide to the investigation and sampling of potentially contaminated soil. Part 1: Non-volatile and semi-volatile compounds (and any subsequent editions)
- AS 4482.2-1999 Guide to the sampling and investigation of potentially contaminated soil. Part 2: Volatile substances (and any subsequent editions)
- In the case of potentially Acid Sulfate Soils, the *Tasmanian Acid Sulfate Soil Management Guidelines* published by Department of Primary Industries, Parks, Water and Environment should be consulted.

*In-situ* sampling is generally not recommended for classification of soils that are to be excavated later for disposal. However, if this method of classification is unavoidable, then the Australian Standards listed above should be adhered to in order to obtain a representative number of samples.

All sample analyses must be conducted by a laboratory registered with the National Association of Testing Authorities, accredited for the testing procedures undertaken ('NATA accredited'), or by a laboratory approved by the Director for the test.

**2.2.1 Sampling density**

The number of samples required for adequate classification of soil is dependent on the volume of material, the estimated standard deviation of contamination concentrations, and the estimated average concentration. However, as a general rule for homogeneous stockpiled soil one sample should be taken every 25 m<sup>3</sup>.

**2.2.2 Composite sampling**

Generally, composite samples are not recommended for classification of soil for disposal. However, composite sampling may assist an environmental program by reducing sampling costs that could be spent elsewhere in the program. Composite sampling is only acceptable for stockpiled soil containing non-volatile contaminants

Revised November 2012

4

IB105

Information Bulletin No.105

Classification and Management of Contaminated Soil for Disposal

and is **not** an acceptable method for sampling of volatiles such as some hydrocarbon-contaminated soil.

All composite sampling should be undertaken by a suitably qualified person and in accordance with the Australian Standards AS 4482.1-2005 and the National Environmental Health Forum Monograph, Soil Series No. 3 – *Composite Sampling*, 1996.

#### 2.2.3 Sampling materials other than soil

For materials such as contaminated construction materials there are no guidelines available for determining the representative number of samples for testing. Surface scrapings or bored samples may be required to classify the material. The person undertaking the sampling, preferably an environmental consultant should develop a sampling strategy and density that adequately classifies the material.

#### 2.2.4 Leachable fraction

In order to classify soil for disposal, the leachable concentrations of metals and some organics should be undertaken. Where a leachable concentration is prescribed in Table 2, generally that value will take precedence over the total concentration value and will be used as the sole determinant of final classification for disposal.

The most appropriate procedure for determining the leachable fraction should be determined in consultation with an environmental consultant, the EPA and the analytical laboratory performing the procedures and with consideration of the waste management goals that are to be achieved. Accepted methods for determining leachable fractions are detailed below:

The Toxicity Characteristic Leaching Procedure (TCLP), in accordance with USEPA Method 1311 – SW 846, is used to simulate the leaching of contaminants into groundwater under conditions found in solid waste landfills.

The Multiple Extraction Procedure (MEP), in accordance with USEPA MEP Method 1320 – SW 846, is used to simulate leaching from repetitive acid washings and is a more rigorous test of the buffering capacity of the soil than the TCLP. In some circumstances (e.g. for remediation technologies that involve solidification with lime based agents), the MEP would be a more suitable test to determine the long-term stability of soil.

There is also an Australian Standard for the preparation of leachates: AS 4439-1997 (parts 1 to 3), *Wastes, Sediments and Contaminated Soils: Preparation of Leachates*.

#### 2.2.5 Acid sulfate soils

Potentially Acid Sulfate Soils (PASS) underlie parts of Tasmania's coastline and may also underlie inland areas such as peat bogs, salt lakes and wetlands. They are natural soils that contain sulfides (mostly iron sulfides). In an undisturbed and waterlogged state these soils are harmless, but when disturbed (such as dredging estuaries etc), a process of oxidation can produce sulfuric acid in large quantities. As the acid moves through the soil profile it may 'mobilise' or cause the release of metals and other toxins from the soil, which eventually flow into surrounding waterways. Acid Sulfate Soil (ASS) runoff therefore has significant environmental, economic and social impacts. The *Tasmanian Acid Sulfate Soil Management Guidelines* provide guidance on the level of management required to minimise the risk associated with ASS. The *Guidelines* also provide criteria to characterise acid sulfate soils. The criteria in Table 2 of this Bulletin do not apply to any soils classified as PASS. Such soils should be managed as potentially acid sulfate soils. Acid Sulfate Soil predictive mapping is available for Tasmania at [www.thelist.tas.gov.au](http://www.thelist.tas.gov.au). For further information regarding ASS, instructions on how to utilise the predictive mapping, or obtain a copy of the *Guidelines*, refer to:

<http://www.dpiw.tas.gov.au/inter/nstf/WebPages/SWEN-83NVBG?open>

Revised November 2012

5

IB105

Information Bulletin No.105

Classification and Management of Contaminated Soil for Disposal

### 3. Re-use or disposal - waste management plan

A Waste Management Plan should be developed following the classification of soil to determine whether the soil can be remediated or re-used instead of, or prior to, disposal (see Figure 1, which summaries this process, and section 5 which details the information required).

It should be noted that a controlled waste will not be suitable for re-use in sensitive environments such as wetlands, agricultural areas or residential sites.

### 4. Disposal of contaminated material

Classification of soil (as defined in Table 2) will determine the category of landfill to which the soil can be disposed of in accordance with the landfill operator's permit conditions.

If disposal is the only viable management option, all possible efforts should be made to reduce the volume of material requiring disposal by minimising excavated volumes and segregating and sorting of wastes prior to disposal.

| Waste Type   | Category A landfill -<br>Solid Inert Landfill | Category B landfill -<br>Putrescible Landfill | Category C landfill -<br>Secure landfill |
|--|---|---|--|
| Level 1 – <i>Fill Material</i>                     | ✓   | ✓   | ✓  |
| Level 2 – <i>Low Level Contaminated Soil</i>       | ✗   | (refer to Section 4.2.2)                      | ✓  |
| Level 3 – <i>Contaminated Soil</i>                 | ✗   | ✗   | ✓  |
| Level 4 – <i>Contaminated Soil for Remediation</i> | ✗   | ✗   | ✗  |

See the *Landfill Sustainability Guide 2004* (DPIWE, 2004) for further details.

#### 4.1 Disposal of fill material (Level 1)

**4.1.1** The off-site disposal of *Fill Material* is not restricted and may be used as cover in landfills.

**4.1.2** The definition of *Fill Material* includes inert construction material, soils and rocks, which have not been contaminated with any substance, and stable asphalt or bituminous pavement material, all of which are generally considered inert for use as 'fill'. However, soil and other material classified as *Fill Material* can still be a 'pollutant' under EMPCA and must be responsibly managed.

#### Re-use of fill material

**4.1.3** The re-use of *Fill Material* must not result in environmental harm. *Fill Material* might contain contaminants above background levels and therefore may not be suitable for all uses, e.g. for sensitive uses such as child play areas, residential uses, or in protected nature reserves

**4.1.4** In some cases, unwanted 'waste' soils or rock imported from another site to be used as fill may naturally contain contaminants at levels that are higher than *Fill Material* criteria due to regional geological characteristics. This material would be regarded

Revised November 2012

6

IB105

Information Bulletin No.105

Classification and Management of Contaminated Soil for Disposal

as unsuitable for re-use if it posed a risk to human health or the environment in its new location.

The risk posed by importation of materials with naturally elevated levels of certain contaminants should be assessed by an environmental consultant and the evaluation and supporting information submitted to the Director for approval.

- 4.2 Disposal of low level contaminated soil (Level 2)** *Low Level Contaminated Soil* may, in some cases, be suitable for disposal as intermediate landfill cover at nominated municipal landfills. Please note that the landfill operator should refuse soil that has not been classified and approved if there is likelihood that acceptance of the material may result in a breach of the landfill operator's permit conditions.

- 4.2.2** Approval for the disposal of *Low Level Contaminated Soil* must be sought from the landfill operator and the EPA. The information detailed in section 5 of this bulletin must be supplied to the EPA when making an application for approval to dispose of a waste.

**Landfills at which *Low Level Contaminated Soil* (Level 2) may be accepted:**

| Council / Authority                                   | Landfill                       |
|---|--------------------------------|
| Circular Head Council                                 | Port Latta Waste Depot         |
| Dulverton Regional Waste Management Authority (DRWMA) | Dulverton Regional Waste Depot |
| Launceston City Council                               | Remount Rd Waste Depot         |
| Copping Refuse Disposal Site Joint Authority          | Copping Waste Depot            |

**Re-use of low level contaminated soil**

- 4.2.3** *Low Level Contaminated Soil* might be suitable for re-use as fill or levelling material on an industrial or commercial site, but will be judged on a case by case basis. In determining whether *Low Level Contaminated Soil* may be used as fill, an assessment of the environmental and human health hazards associated with the disposal option must be conducted by a suitably qualified environmental consultant. If the soil is classified as a controlled waste, approval must be sought from the Director as detailed in section 5.

- 4.3 Disposal of contaminated soil (Level 3)** *Contaminated Soil* can only be disposed of at landfills that have the appropriate permit conditions and within a separate lined and contained cell.

- 4.3.2** Approval for the disposal of *Contaminated Soil* must be sought from the landfill operator and the EPA. The information detailed in section 5 of this bulletin must be supplied to the EPA in making an application for approval.

- 4.3.3** Only permitted landfills are allowed to accept Level 3 waste. Furthermore, it is at the landfill operator's discretion as to whether or not they will accept the waste. At the date of publication, no Tasmanian landfill is receiving level 3 waste for disposal.

**4.4 Contaminated soil for remediation (Level 4)**

- 4.4.1** *Contaminated Soil for Remediation* requires remediation or treatment prior to disposal to reduce total concentrations and/or leachable concentrations to levels acceptable for landfill disposal or re-use.

- 4.4.2** The producer (defined in the Regulations) of the *Contaminated Soil for Remediation* is responsible for identification of the treatment options, which will depend on the

Revised November 2012

7

IB105

Information Bulletin No.105

Classification and Management of Contaminated Soil for Disposal

waste and pollutant type, waste volumes and the availability of suitable facilities in which to manage the remediation. Typical forms of treatment currently being used for remediation of contaminated soil include bioremediation, thermal treatment/desorption, soil washing, soil vapour extraction, red mud, chemical treatments and stabilisation. Specific treatment of hydrocarbon contaminated soil by bioremediation is encouraged under appropriate circumstances, as detailed in the EPA's *Information Bulletin 108: Landfarming of Petroleum Contaminated Soils*.

- 4.4.3 The suitable technologies for waste treatment may not be available in Tasmania and thus treatment may require transport to an interstate facility. Advice on interstate treatment options should be sought from the Controlled Waste Management Officer.
- 4.4.4 If the soil is to be disposed of after treatment, the EPA encourages treatment methods that minimise soil volumes prior to disposal to conserve landfill space.
- 4.4.5 If the remediation method has the potential to cause environmental harm, as defined in EMPCA, advice from the Director should be sought.
- 4.4.6 *Regulation 6 - General Responsibilities* of the Regulations requires that a person must not remove, receive, store, reuse, recycle, reprocess, salvage, incinerate, treat or use for energy recovery a controlled waste as defined within the Regulations unless approved to do so.

## **5. Approvals**

### **5.1 Approval process**

The waste producer, or consultant/contractor acting on behalf of the waste producer, is responsible for applying for approval for soil disposal, re-use options or remediation.

Applications are to be sent to the Director, EPA. Please allow up to ten working days for the Director to respond to an application. Please note that where it is intended to dispose of material to a landfill, an 'in principle' agreement from the landfill should be gained by the applicant prior to disposal.

Upon approval of the application, the Director, or a person authorised by the Director will provide written notification to the applicant of the approved classification of the waste where appropriate. The landfill authority will also be forwarded a copy of the approval, along with a copy of the analytical results and any other relevant information so that they can monitor waste entering the landfill.

### **5.2 Information required**

An application for approval to dispose of, re-use, treat, remediate, etc, soil must contain the following information:

#### **Introduction:**

- Details of the site(s) from which the soil is to be removed, including a brief site history and why the soil is thought to be contaminated, or likely to cause environmental harm;
- Description of the soil;
- Estimate of the volume of soil to be managed.

#### **Sampling details:**

- Sampling density and analytical suite to classify the soil;
- Sampling protocols followed;

Revised November 2012

8

IB105

Information Bulletin No. 105

Classification and Management of Contaminated Soil for Disposal

- Scaled sampling plan showing, for example, soil stockpiles and sample locations and contamination sources;
- NATA endorsed laboratory reports.

**Waste management plan:**

- Proposal for the management of the soil that is in accordance with relevant guidelines and standards;
- If the soil is to be disposed of, provide justification for why re-use, on-site treatment, etc is not proposed;
- Details of the proposed management method, for example the name of the landfill facility that you wish to dispose of the soil at, or details of the treatment or re-use etc;
- The name of the waste transporter that you will be utilising (see Section 6 for further details); and
- If the soil is to be re-used, recycled, treated, etc, and is a controlled waste, the waste producer must apply for an environmental approval from the Director (R.12 of the Regulations). Relevant information required by the EPA to consider an application for an environmental approval is detailed in R.12(3) of the Regulations. A R12 application form can be accessed at:  
<http://epa.tas.gov.au/regulation/required-approvals-and-authorisations>

In situations where a site investigation report has already been lodged with the EPA, duplication of information provided in that report is not required. However, in all cases, the application will need to make reference to the specific sample numbers used for soil classification.

**6. Transport of contaminated material**

If a controlled waste is to be transported, a waste transport business holding a current relevant approval for that particular waste type and issued under EMPCA is required. For information regarding currently approved Waste Transporters, either contact the Controlled Waste Transport Officer (see below) or a list can be accessed at:  
<http://epa.tas.gov.au/regulation/document?docid=1063>

Caution should be taken when transporting any material to ensure its safe transportation and prevention of secondary impacts (e.g. dust).

**7. Further information**

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

## EXECUTIVE SUMMARY

This report presents the findings of two environmental site assessment events, the first March 2016 and the second August 2017; undertaken by Geo-Environmental Solutions Pty. Ltd. (GES) at the former Roberts Limited site at 2 Collins Street, Hobart - hereby referred to as 'The Site'. GES was commissioned by Fragrance TAS – HOBART (Collins) Pty Ltd to conduct the site assessment. This is document *Version 8*, it contains minor amendments from previous versions.

The purpose of this investigation is to comply with Hobart City Council planning requirements and the Sullivan's Cove Planning Scheme 1997.

It is proposed that a multistory building development will cover the entire site which will include commercial premises on Level 0, Level 1 and Level 1a; carparking on Levels 2 to 4, a podium on Level 5, a pool and wellbeing rooms on Level 6 and hotel apartments from Level 7 to Level 14. There will be six lift and three staircases.

The proposed final floor level will be at 4.60m AHD which is approximately 1m above the current site level and approximately 1m of fill be required, give or take, across the entire site. All site surfaces are to be removed and subsequent excavations are expected to be minimal and will be required for services, the building footings and lift wells/stairs only. Appropriate soil disposal associated with the development will be required.

A preliminary site assessment was conducted which revealed a varied site usage history with potentially contaminating activities (areas of potential concern) including tanning operations, uncontrolled site filling, maintenance workshop and petroleum hydrocarbon storage.

An initial desktop and invasive soil and groundwater assessment conducted in March 2016, involved drilling a total of 13 soil investigation bores and the sampling of four out of five groundwater monitoring wells. A second invasive soil and groundwater assessment conducted in August 2017, involved the drilling of nine additional soil bores and the sampling four of the five existing groundwater monitoring wells. All information collected during these assessments is compiled within this document.

Within the identified areas of potential concern, samples were analysed for the following contaminants of potential concern:

- Suite of 15 Metals;
- Fuel type petroleum hydrocarbons; and
- Coal waste and kerosene related hydrocarbons.

Uncontrolled fill was encountered across much of the site to depths of greater than 3.3 m below ground surface with the deepest fill apparent in the center of the site along a former watercourse and within a historical water race running through the site. Fill comprised of mixed alluvial type clay, silt, sand and gravel sediments with occasional bricks. Fill in the local area is also known to contain significant amount of waste coal material from the historical Hobart Gas Works which is commonly contaminated with polynuclear aromatic hydrocarbons compounds. Natural underlying sediments comprised of clay, silt and sand of a similar composition to the fill.

Groundwater flow directions were discerned to be directed towards the center of the site at a very shallow gradient towards the original Hobart Town Rivulet stream channel to the southeast. Groundwater migrating from the site is likely to follow the path of least resistance and travel in an southeasterly direction towards Victoria Dock. It is unlikely that groundwater will travel towards the now enclosed Hobart Rivulet because in is upgradient to the site;

Guideline limits for assessing 90% protection of marine waters are not exceeded for hydrocarbons (polynuclear aromatic hydrocarbons) but are exceeded for heavy metals including copper, zinc and mercury in groundwater. The source of these compounds is interpreted to be coal waste products or general industrial activities which may source from offsite. Copper and zinc do not exceed soil ecological investigation levels.

GES understands that the existing surface material (bitumen, concrete and buildings) are to be removed, new fill brought to site and the site sealed with a concrete slab. During site development work, soil exposure may cause the mobilisation of some contamination, such as polynuclear aromatic hydrocarbons and heavy metals. Contaminated soil exposure should be minimised and the contamination management plan should always be followed. Care should be taken to ensure that contaminated soil is not washed into storm water culverts which could ultimately enter the marine environment.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

Onsite human health risk is identified from soil ingestion and soil dust inhalation (from lead and polynuclear aromatic hydrocarbons compounds). A single sample collected from the fill material was identified to present a dermal contact risk. Primary concerns are polynuclear aromatic hydrocarbons and lead compound exposure from excavated fill at the site during site development works. The identified pathway is soil ingestion or dust inhalation risk to commercial workers. If the dust and stormwater runoff is not managed adequately, this may present a hazard to offsite residence and public within the surrounding areas. Without management there is a likely chance of contamination exposure to offsite receptors and a high associated risk to receptors.

Given that the proposed future ground floor is expected to be entirely paved with an additional 1 m of clean fill between the floor and the contaminated material; there is expected to be limited opportunity for contaminated soil exposure to future site users. There may be ongoing future risk to shallow trench workers however this is will only occur if excavations that are greater than 1m below the ground surface, where the existing site material is intercepted.

There is evidence of four historical underground storage tanks present at the site which held hydrocarbon fuels including diesel. There are no underground storage tank decommissioning records and the location of any remaining tanks has not been delineated by invasive soil investigations to date (except for the subfloor tank in the building). Therefore, the one identified tank and any further tanks would require decommissioning according to Environmental Protection Authority regulations as part of site redevelopment. Benzene Toluene Ethylbenzene Xylene compounds are present in low concentrations in an isolated onsite bore indicating there is likely to have been historical product release.

GES have conducted extensive soil drilling and have not identified a petroleum vapour intrusion risk from hydrocarbons in soil or groundwater around the tank locations or anywhere on the site. An indoor or trench worker vapour intrusion risk is not apparent at the site based on the proposed development. This based on extensive testing of soil from surface to groundwater depths as well as groundwater sampling and analysis.

The most significant management issue at the site is the uncovering during excavation of polynuclear aromatic hydrocarbons and heavy metal contaminated soil within fill beneath the site. Highest concentrations of contaminants have been identified on the south-western side of the former Hobart Town Rivulet. The concentration of all IB105 compounds analysed at the site average out to level 1 except for:

- Total Recoverable Hydrocarbons - C<sup>10</sup>-C<sup>36</sup> which is level 2;
- Total polynuclear aromatic hydrocarbons is level 3; and
- Benzo(a)pyrene is level 3.

Given the historical industrial nature of the site, all excavated soil at the site is to be stockpiled systematically, tested for contamination and results are to be compared against IB105 guidelines and managed appropriately. Stockpile separation is recommended initially as preliminary findings indicate mixing is likely to produce a larger volume of soil which will need licensed disposal.

The Sullivan's Cove Planning Scheme 1997, Schedule 8 states that: *the applicant is to provide information to demonstrate that an appropriate level of cleanup of the site is to occur. Alternatively, the applicant is to demonstrate that the proposed activity will not result in an immediate or likely long term hazard to human health or the environment.* GES can confirm once the development is complete and the site is 100% sealed, there will be;

- No opportunity for exposure to soil contamination by commercial workers or guests to the property, thus mitigating the human health risk; and
- No opportunity for the infiltration of rainwater to mobilise metals or PAH's into the groundwater and/ or the marine environment.
- Minimal risk to human or environmental receptors as there will be no direct pathway-receptor links due to the constructed buildings and surface cover on site

The conclusions and recommendations in this report are based only on information which was obtained during compilation of the site history and on analytical results obtained during the two invasive soil and groundwater investigations. Some of the conclusions and recommendations contained herein may change if the information upon which they are based is later found to be incorrect or incomplete and/or if additional information is subsequently found.

## 1 INTRODUCTION

### 1.1 General

This report presents the findings of two environmental site assessment (ESA) events, the first March 2016 and the second August 2017; undertaken by Geo-Environmental Solutions Pty. Ltd. (GES) at the former Roberts Limited site at 2 Collins Street, Hobart - hereby referred to as 'The Site'. The site location is presented in Figure 1. GES was commissioned by Fragrance TAS – Hobart (Collins) Pty Ltd to conduct the site assessment. This document *Version 8* contains minor amendments from previous versions.

This ESA has been prepared by a suitably qualified and experience practitioner in accordance with procedures and practices detailed in National Environmental Protection Measure (NEPM; 2013) guidelines and key regulations and policies identified in the References section of this document. Personnel engaged in preparing this ESA are listed in Appendix 1 along with their relevant qualifications and years of experience.

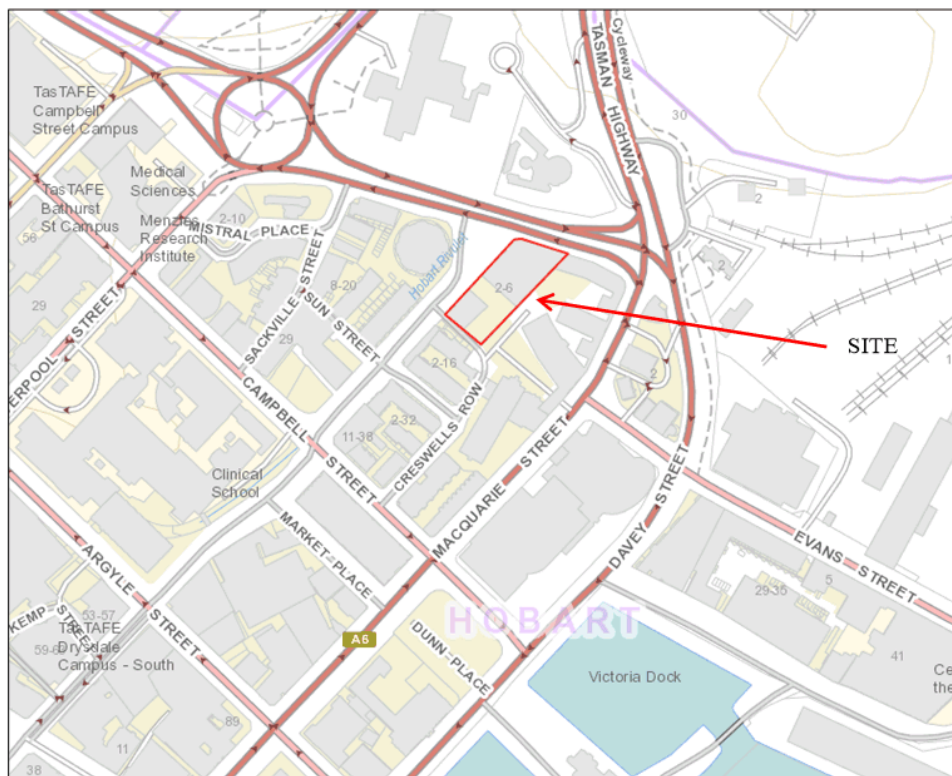

Figure 1 Site Location

### 1.2 Investigation Objectives

The objective of the ESA was to:

- Review the 'Preliminary Environmental Site Assessment' (PESA) report (Scherzic 2015);
- Assess the following at the site:
  - Chemicals of Potential Concern (COPC's);
  - Areas of Potential Concern (APC); and
  - Human and Environmental health risk.
- Determine the potential for offsite impact from site contamination, and implications for offsite ecosystem and human health receptors; and
- Provide recommendations for further assessment remediation and/or management (if required); and
- To comply with Hobart City Council planning requirements and the Sullivan's Cove Planning Scheme 1997.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

### 1.3 Scope of Works

The scope of works of this ESA was to:

- Drill thirteen (13) soil bores at the site to identify potential human health risk to onsite receptors from potentially hydrocarbon impacted soil;
- Through additional soil sampling (an additional nine (9) soil bores) use soil analysis data to assist in:
  - Refine the conceptual site model;
  - Further delineating the extent of potential hydrocarbon leakage from the underground storage tanks (UST's); and
  - Refining the location of underground storage tanks infrastructure.
- Assess the viability of the existing groundwater monitoring wells for collecting representative samples for assessing potential onsite and offsite groundwater impact;
- Through two groundwater monitoring events (GME), collect groundwater from existing monitoring wells and sample for contaminants of concern;
- Detail specific onsite human health risk (hydrocarbon vapor intrusion and direct contact) which may source from any impacted soil and groundwater;
- Assess all risks with respect to proposed future land use which includes site demolition, soil excavation and commercial building development;
- Assess potential impact to surrounding offsite receptors; and
- Develop a conceptual site model (CSM) for the site and offsite if applicable to assess specific potential ecosystem and human health receptors.

### 1.4 Assessment Trigger

The need for this assessment has been triggered by the following:

- The ESA is a requirement for the Development Application.
- The site falls within the Hobart City Council contaminated site overlay and need to be assessed in accordance with the following interim planning scheme code:
  - *E2.6.2 Excavation.*
- Given that there is proposed **excavation works** at the site, there are no acceptable solutions to proposed works, and therefore E2.6.2 P1 performance criteria are to be addressed

### 1.5 Performance Criteria

**Excavation** does not adversely impact on health and the environment, having regard to:

- (a) an environmental site assessment that demonstrates there is no evidence the land is contaminated; or
- (b) a plan to manage contamination and associated risk to human health and the environment that includes:
  - i. an environmental site assessment;
  - ii. any specific remediation and protection measures required to be implemented before excavation commences; and
  - iii. a statement that the excavation does not adversely impact on human health or the environment.

The risk assessment herein depends on likely soil, groundwater or vapour exposure pathways based on:

- Present site conditions;
- Proposed development site layout and building construction; and
- Site earthworks.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

## 2 SITE DETAILS

### 2.1 Site Location & Identification

Site details are presented in Table 1.

**Table 1 Site Details**

|  |
|--|
| SITE LOCATION  |
| 2 Collins Street, Hobart, Tasmania   |
| APPROXIMATE SITE AREA  |
| 3009 m <sup>2</sup>  |
| TITLE REFERENCES   |
| CT 121603/1  |
| SITE OWNER   |
| Fragrance TAS-HOBART (Collins) Pty Ltd   |
| PREVIOUS LANDUSE   |
| 1920's to 1960's – Residential, Roberts & Garage/Tram service  |
| 1860's to 1910's – Residential, Fellmonger & Tannery & Hobart Town Rivulet   |
| 1820's to 1860's – Residential, Fellmonger Wool-strapping Hobart Town Rivulet & Slaughter yards  |
| SITE LAND USE  |
| Zoned '1.0 Inner City Residential(Wapping)' under the Sullivan's Cove Planning Zone<br>The current land use is considered commercial based on current land usage.                            |
| PROPOSED LAND USE  |
| It is proposed that the site will consist of hotel accommodation with supporting ancillary commercial activities.  |
| SURROUNDING LAND USE   |
| Zoned '1.0 Inner City Residential(Wapping)' under the Sullivan's Cove Planning Zone.<br>Existing surrounding land used includes residential and hotel accommodation, commercial office space |
| SITE COORDINATES   |

### 2.2 Planning

### 2.3 Site Zoning

The site is zoned Inner City Residential (Wapping) under the Sullivans Cove Planning Zones (Figure 2). The land use surrounding the site is consistent with the zoning; adjacent to the site land is Inner City Residential (Wapping) and beyond this block the land in the north, east and south are part of the Sullivans Cove Planning Scheme of 1997 and include Sullivans Cove Mixed Use, Sullivans Cove Gateway and Transport and Sullivans Cove Working Port. To the west is the Hobart CBD with the following zoning: Central Business, Commercial, utilities, and particular purpose including Royal Hobart Hospital and the UTAS campus.

Environmental Site Assessment – Version 8 – 2 Collins Street. 26 July 2018

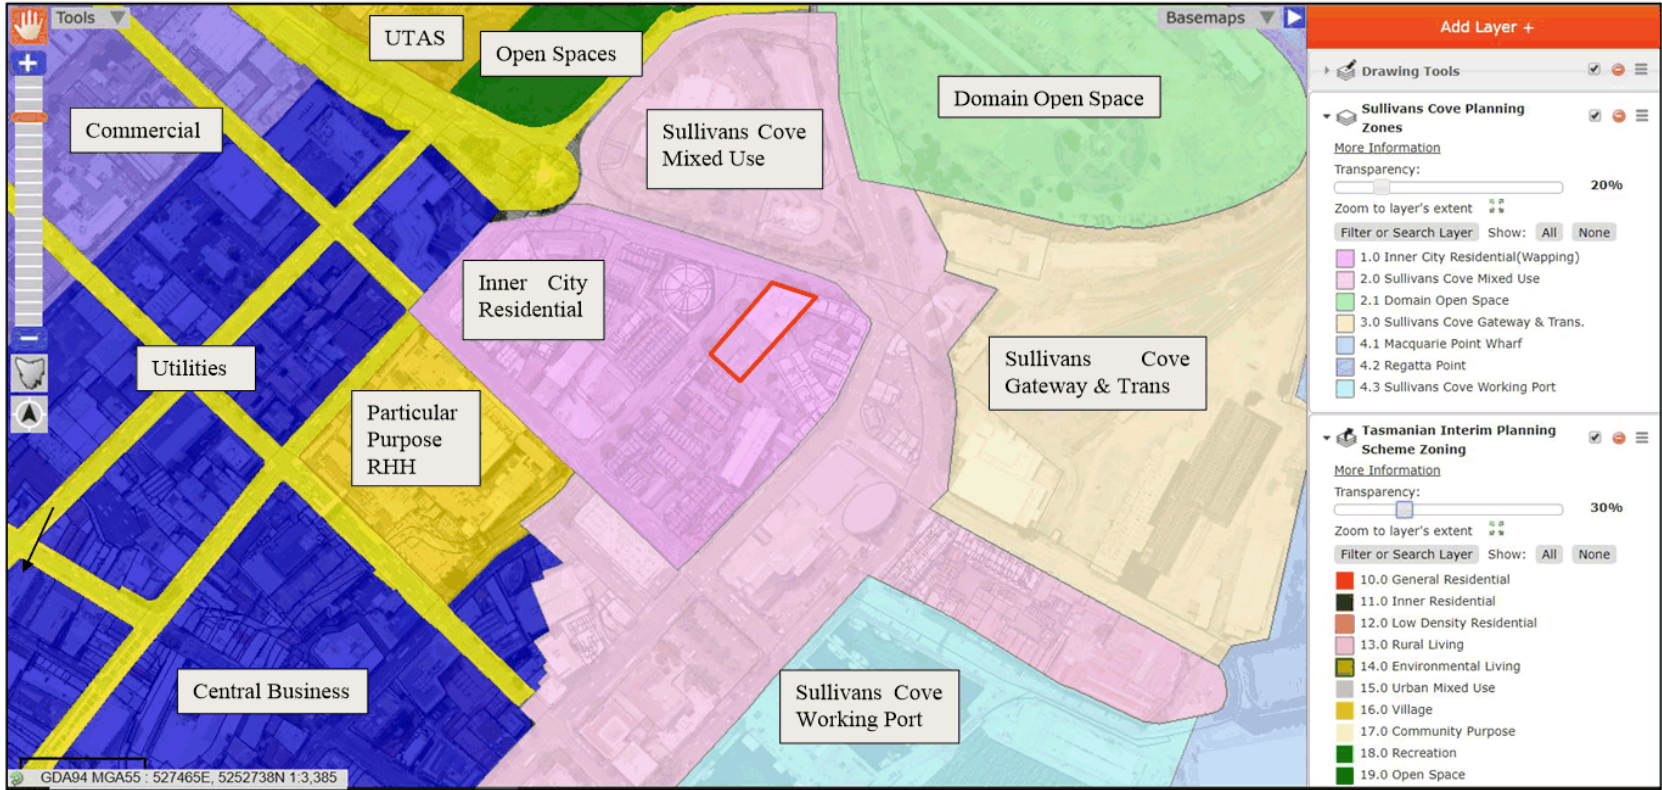

Figure 2 Council planning zones (2015), site outlined in red

*Environmental Site Assessment – Version 8 – 2 Collins Street. 26 July 2018*

## 2.4 Existing Site Layout

The existing site is made up of several buildings and a large paved area for carparking. See Figure 3.

## 2.5 Proposed Site Development Works

A hotel building is proposed for the entire site. The plans produced by S Group include the following:

- Ground floor – Level 0: (4.6 m AHD) Commercial premises including hotel reception, hotel restaurant, hotel kitchen, one retail outlet space, three office spaces several storerooms, a café kitchen and restaurant, a total of six lift, male and female toilets, ramp and drive way to access upper level carparking, a coach parking and deliver vehicle park. Figure 4
- Level 1: Commercial spaces including conference room with stage to seat 1000 people, kitchen, small conference room, two small conference rooms, toilets and lounge.
- Level 1a: Storage and administration spaces.
- Level 2 to 4: Designated carparking.
- Level 5: Podium
- Level 6: Pool and wellbeing rooms
- Level 7-14: Hotel rooms with some 2-3-bedroom configurations.

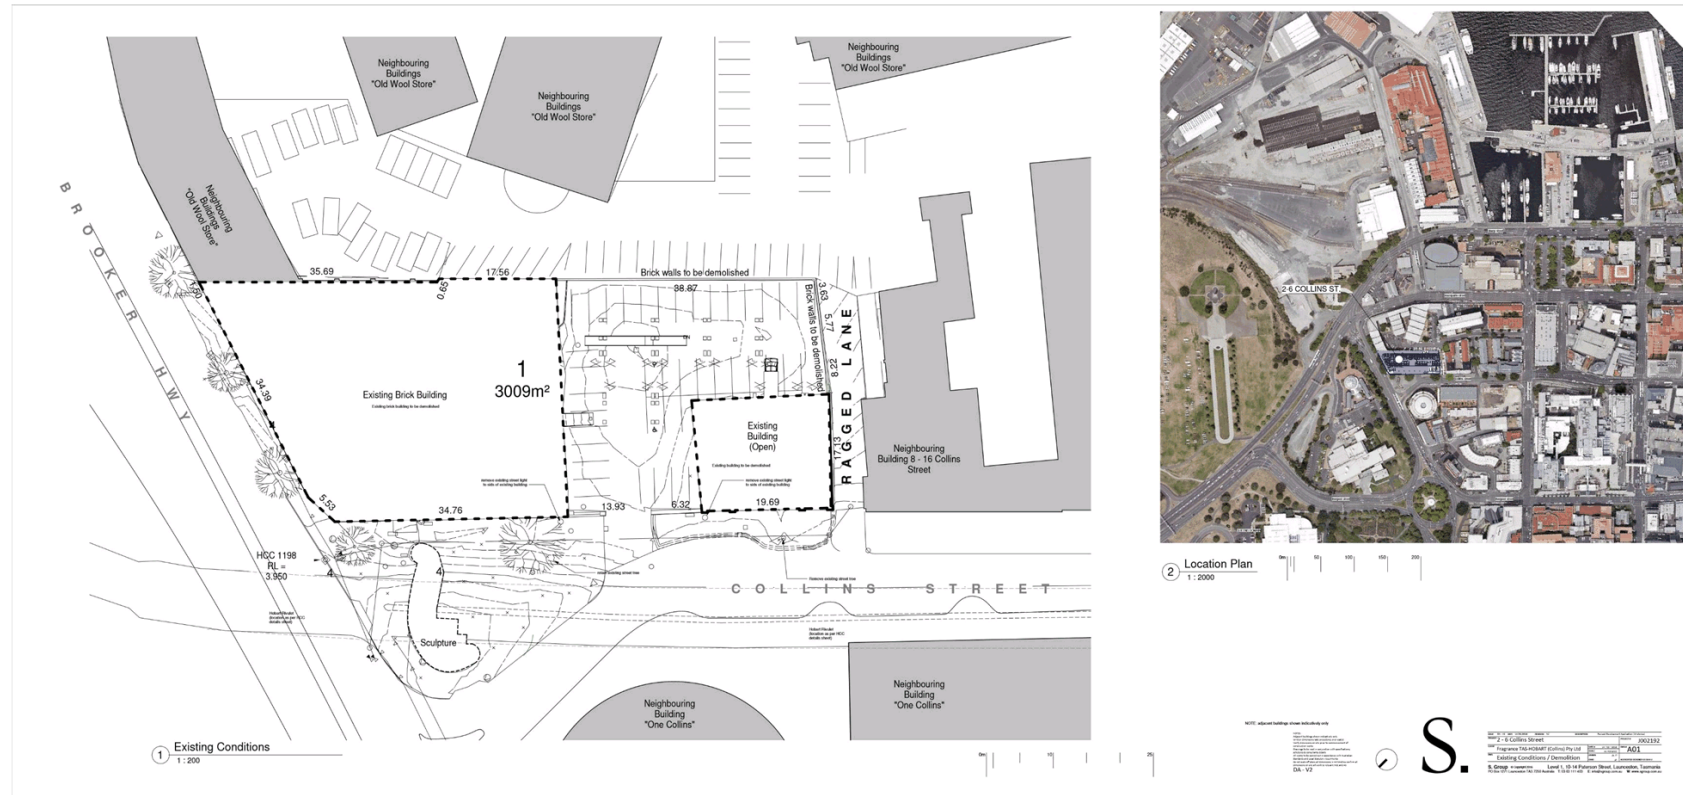

The proposed final floor level will be at 4.60m AHD which is approximately 1m above the current site level and approximately 1m of fill be required, give or take, across the entire site. Excavations are expected to be minimal and will be required for services, the building footings and lift wells only. Appropriate soil disposal associated with the development will be required.

Excavation works as part of the development is anticipated to include:

- Decommissioning existing infrastructure at the site which includes:
  - Bitumen surfaces,
  - All building infrastructure;
  - Redundant services across the site;
  -
- Leveling of the site;
- Installation of underground infrastructure such as pipes for water/ storm water and cables for electricity;
- Excavations/ drilling for the new buildings deep footings; and
- Shallow excavations for the cavity for the six lift wells and stair cases.

Soil which is excavated from the site for landfill disposal is to be assessed against Information Bulletin 105 (IB105) for Classification and Management of Contaminated Soil for Disposal.

Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018

**Figure 3 Exiting Site Plan**

**Figure 4 Proposed Ground floor Plan**

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

## 2.6 Historical Drainage Conditions

Sprent's Book Mosaic of Hobart Town (The LIST), published in 1841 illustrates the presence of a water race running to the north of the site, see Figure 5. The water race meets up with the former Hobart Town Rivulet which drains beneath the site. The Hobart Town Rivulet is inferred to have been infilled with manmade materials of unknown composition.

Figure 5 1841 Sprent Book Mosaic of Hobart Town (The LIST) Illustrating Historical Site Drainage

## 2.7 Current Drainage Conditions

As illustrated above, the historical drainage of the Hobart Rivulet was beneath the site. Over time the path of the Hobart Rivulet has been altered and diverted into a large enclosed drainage system, see the current path of the Hobart Rivulet in Figure 6.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

**Figure 6** Current Hobart Rivulet Path (The LIST) in relation to the site plus the distance to the centre of the manmade channel.

## 2.8 Previous Environmental Site Investigations

### 2.8.1 Scherzic (2015)

The PESA scope of works included the following:

- A review of historical photos, and titles search, dangerous goods records and council consultation
- Site inspection/walkover; and
- A limited laboratory non-compliant soil investigation of soil collected from site geotechnical boreholes.

The investigation broke the site up into different areas of past activities. Although no contamination could be identified from the assessment, the assessment has been useful in generating a preliminary site conceptual model. Identified areas of historical activities are presented in Figure 7.

### 2.8.2 GES (2016)

Version 1 of this report was written in April 2016. As identified in the Document Control section of this report, the GES 2016 document and subsequent versions have been incorporated into this document.

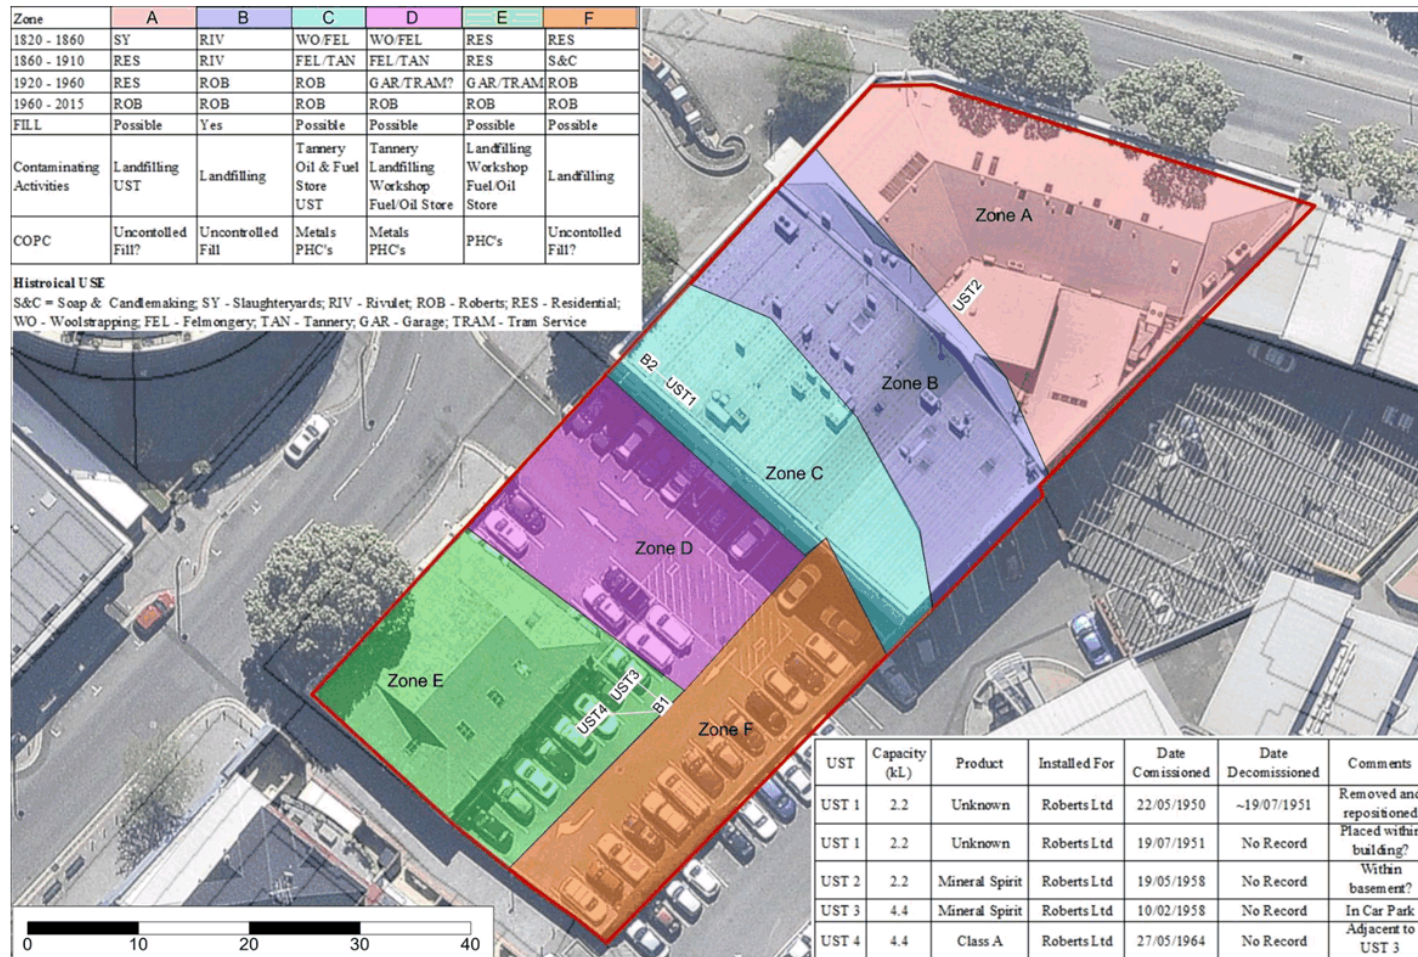

## 2.9 Site Topography

Most of the site is near flat and lies within the 3 to 4m contour. Parts of Zone A ramp down from these typical elevations. In general, the site is below the level of the highway. The site is fully paved and it is expected the storm water is channeled directly towards Victoria Dock.

See Figure 8 for accurate heights of the site and inferred groundwater flow direction.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

**Figure 7 Areas and Contaminants of Potential Concern Based on Site History**

Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018

Figure 8 Height Elevations across the site, Mt. Wellington LIDAR 2010 (m AHD)

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

## 2.10 MRT Geology Mapping

The geology of the site has been mapped by Mineral Resources Tasmania, see Figure 9. The site is inferred to be underlain with:

- Quaternary undifferentiated bay, estuarine, deltaic and alluvial deposits of sand, shelly sand, pebbly sand, pebble to boulder size gravels, clayey sand, silt and clay beneath Zones D, E & F (Qi);
- Quaternary alluvial gravel, sand and clay beneath Zone A; and
- Manmade deposits (uncontrolled fill) within the former Hobart Town Rivulet (Zone B) as well as over the top of the former tannery within Zone C.

Manmade deposits infilled into the former water race to the north of the site are not included in the MRT mapping.

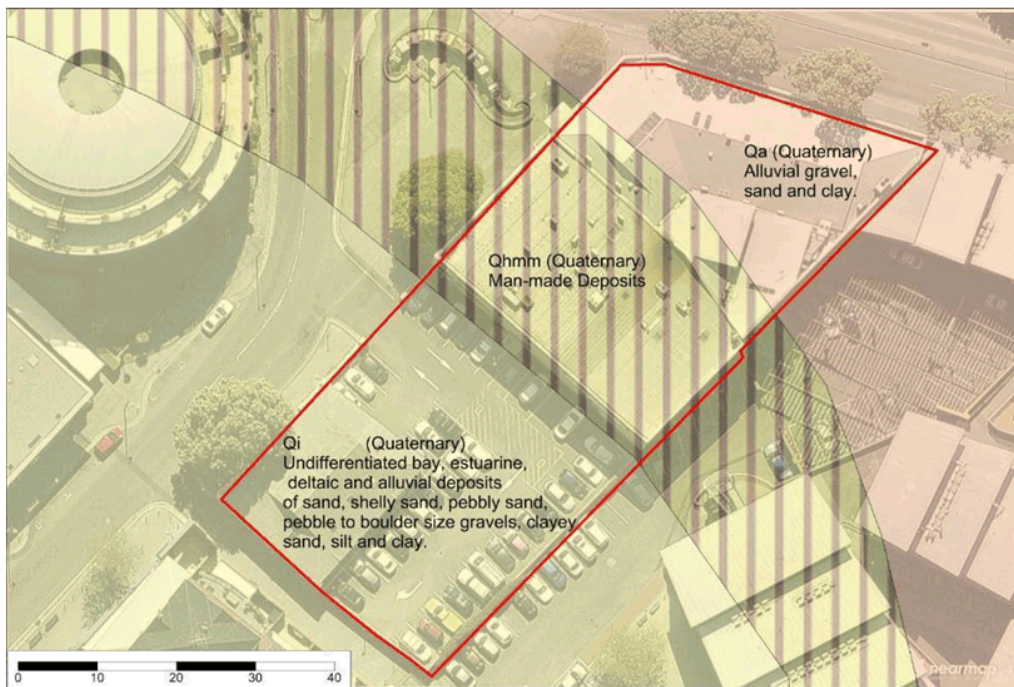

The findings indicate that natural ground has the potential to be shallow beneath Zones A, D, E, & F.

## 2.11 Areas of Potential Concern

The following information has been drawn from the PESA completed in 2015 (Scheric 2015). Refer back to the areas of potential concern in Figure 7. There is evidence for potentially multiple contaminant types at the site which include:

- 1860 to 1910 tanning operations within Zone's C and D;
- Backfilling of the Hobart Town Rivulet (Zone B) within the 1920's (probably uncontrolled);
- Potential fuel and oil storage in Zones D and E in the 1920's to the 1960's within the garage and tram service areas;
- Potential land reclamation and elevation of ground levels following each phase of site redevelopment;
- Post 1950's, when the land was owned by Roberts Ltd there were:
  - a single UST (UST 1) and bowser indoors within Zone C;
  - a single UST (UST 2) which is positioned on a stand within Zone A basement; and
  - two underground storage tanks (UST 3 & UST 4) and a single bowser present within Zone E.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018***Figure 9 Local Geology**

There is the potential for both soil and groundwater at the site associated with the UST's. Soil impact may have also occurred because of the use of uncontrolled fill, the use of heavy metals in tanning operations and the leaching of contaminants from the tram service area and associated workshop.

Chromium tanning processes were not discovered until approximately the same time the site tannery was decommissioned.

Types of contaminants that may be found in uncontrolled fill around Wapping area include hydrocarbons from coal waste (polynuclear aromatic hydrocarbons (PAH) compounds).

## 2.12 Contaminants of Potential Concern

Contamination from the site source from underground fuel storage and dispensing infrastructure. COPC include the following:

- Total Petroleum/Recoverable Hydrocarbons (TPH/TRH) sourcing from UST's and associated infrastructure;
- Mono Aromatic hydrocarbons: Benzene, Toluene, Ethylbenzene, Xylene (BTEX) potentially from UST's and associated infrastructure;
- PAH are identified in the general area (in both fill and natural soils) because of historical land use practices; and
- Heavy metals within fill.

Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018

### 3 FIELD INVESTIGATION PROCEDURES

Site investigation works are summarised in Table 2 and Figure 10. The soil investigation was completed in three stages, which explains the Testhole (TH) and borehole (BH) prefix. Groundwater monitoring well 7716-3 was gauged but not sampled on the 15/03/2016 due to a well obstruction. Groundwater monitoring well 7716-1 was not gauged or sampled on the 7/08/2017 due to a well obstruction.

**Table 2 Summary of Site Investigation Works**

| Hole ID                              | Soil Bore Drill & Sample | Well Install    | Survey | Develop Wells   | Slug Test | Well Gauge <sup>#</sup> | Well Purge & Sample |
|--------------------------------------|--------------------------|-----------------|--------|-----------------|-----------|-------------------------|---------------------|

| 7716-3                               | NA                       | NA <sup>1</sup> | NA     | NA <sup>1</sup> | NA        | 15/03/16                | NA                  |
| 7716-1 & 77165-2<br>7716-4 & 77165-5 | NA                       | NA <sup>1</sup> | NA     | NA <sup>1</sup> | NA        | 15/03/16                | 15/03/16            |
| 7716-1                               | NA                       | NA              | NA     | NA              | NA        | NA                      | NA                  |
| 7716-2 & 77165-5                     | NA                       | NA              | NA     | NA              | NA        | 7/08/17                 | 7/08/17             |

NC – Not Conducted – Hydraulic conductivity estimates are made based on soil classification

NA – Not Applicable – Only two wells installed. Reliance of hydraulic gradient inferences.

<sup>1</sup> Groundwater wells were installed under the supervision of Scherzic between the 17<sup>th</sup> November 2014 to the 20<sup>th</sup> November 2014. It is presumed that groundwater monitoring wells were installed as per Minimum Construction Requirements for Water Bores in Australia (MCRWBA 2011) and AS5667.11 (1998).

#### 3.1 Soil Investigation

##### 3.1.1 Borehole Drilling

At each of the bore locations, the following precautions were put in place to avoid disrupting underground service assets:

- Dial Before You Dig plans were obtained;
- Archers Underground Service were engaged; and
- Where practical, the first meter of the bore was cleared with a hand auger.

Concrete coring was undertaken through bitumen or concrete at each drilling location as required.

A total of twenty-two (22) 65 mm diameter soil bores were drilled for assessing site geology and sampling for contamination impact (Figure 10). The bores were drilled by GES using a hand auger and or the industry recognized Geoprobe direct push drilling system. The selected drilling method involved using a Geoprobe dual tube to retain wall integrity and eliminates risk of profile collapse whilst allowing extraction of 1.0 m length sample cores and allows for deployment of pre-packed well systems.

Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018

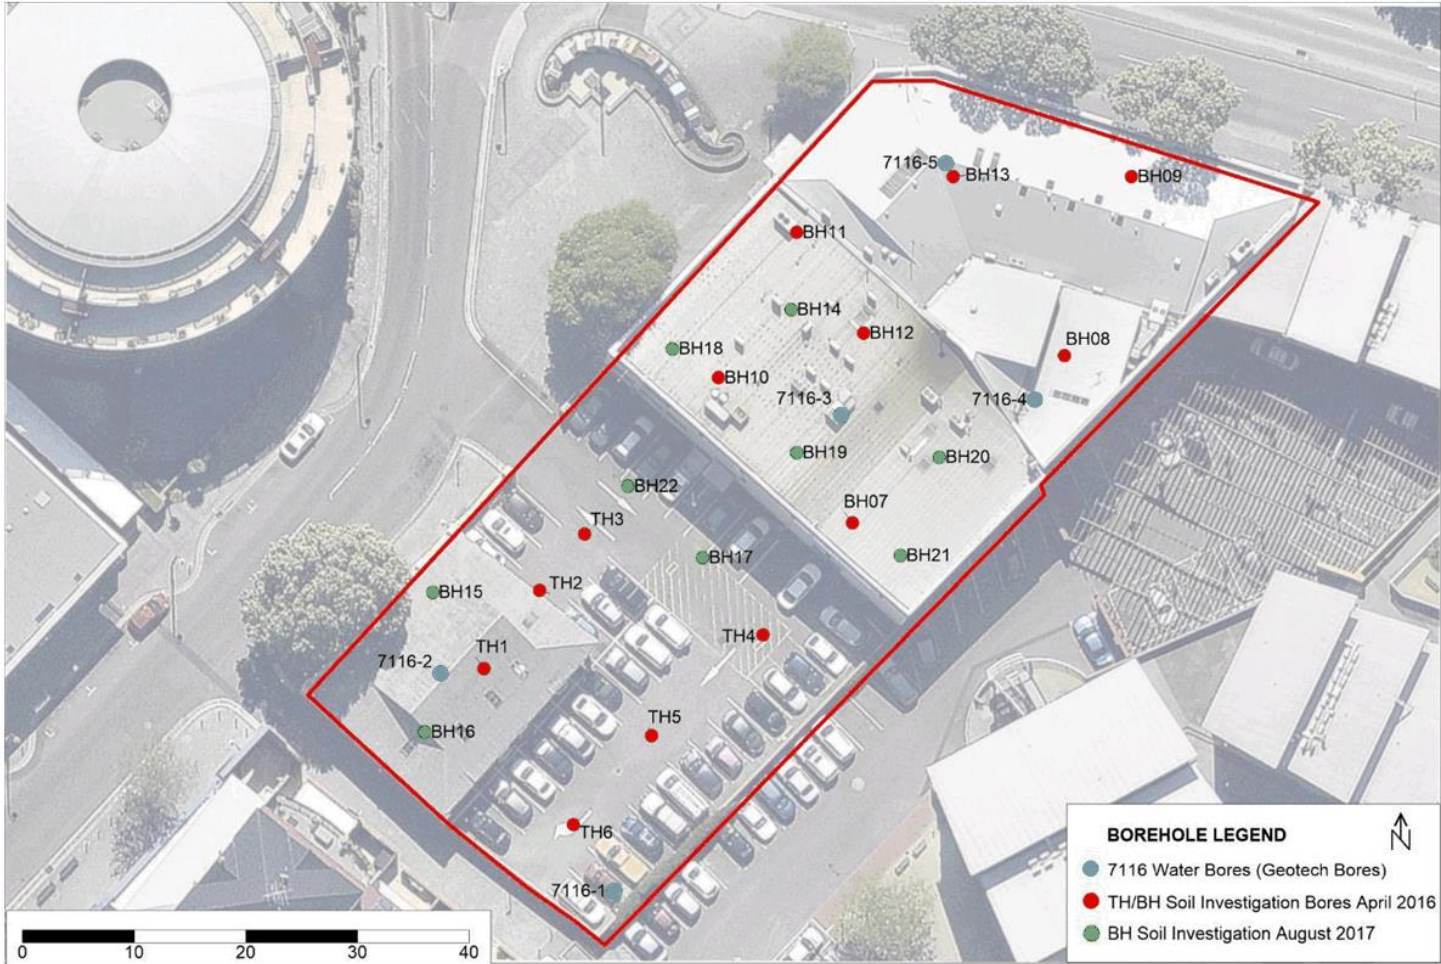

Figure 10 Borehole and Groundwater Monitoring Well locations

Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018

### 3.1.2 Soil Sampling

Soil sampling was conducted according to the National Environmental Protection Measure (NEPM 2013) and AS4482 sampling guidelines. Table 3 presents a summary of the soil assessment methodology adopted at the site.

**Table 3 Summary of Soil Sampling Methods**

| Activity                              | Details / Comments   |
|---------------------------------------|--|
| Soil Logging                          | Samples were extracted from the direct push liner for analysis. Logging the soil was conducted in accordance with the Unified Soil Classification System (USCS) as detailed in AS1726 (1993).  |
| Decontamination of Sampling Equipment | Quantum Clean Laboratory Detergent (R213) was used to decontaminate reusable sampling equipment.   |
| Soil Screening                        | Individual soil samples were collected from the core tray at 0.5 to 1.0 m intervals below ground surface (bgs) and/or change in geology. Collected samples were screened for volatile fractions using a Photoionisation Detector (PID). This was done by placing the samples within snap lock bags and analysing the headspace with a PID probe.   |
| Soil Sample Collection                | Samples were selected for laboratory analysis: <ul style="list-style-type: none"> <li>• where PID values exceeded a nominated value suitable for COPC's</li> <li>• in the case where hydrocarbons were not detected in individual bores using the PID, select samples were collected from representative horizons and submitted for analysis.</li> </ul> A minimum number of samples were carefully selected which would provide sufficient information to delineate hydrocarbon contamination in soils. |
| Sample preservation                   | Samples were placed into a jar for laboratory analysis. Soil jars were placed in a pre-chilled cool box with ice bricks.   |
| Sample holding times                  | Sample holding times were within acceptable range (based on NEPM B3-2013) from collection to extraction.   |

### 3.1.3 Soil Analysis

Primary and Quality Control (QC) samples (excluding triplicates) were submitted to Analytical Laboratory Services (ALS) for analysis. Of the 60 primary samples collected in March 2016, 30 were selected for analysis and 30 were put on hold. Of the 25 primary samples collected in August 2017, 17 were selected for analysis and 8 were put on hold Chain of Custody (COC) documentation was completed and is provided in Appendix 2. Table 4 presents a summary of the laboratory analyses undertaken.

**Table 4 Overview of Soil Analysis and Quality Control (March 2016 and August 2017)**

| Analytes            | Primary Soil Samples | Duplicates <sup>a</sup> | Triplicate <sup>b</sup> | Rinse Blank <sup>c</sup> | Field Blank <sup>d</sup> |
|---------------------|----------------------|-------------------------|-------------------------|--------------------------|--------------------------|
| TPH/TRH             | 47                   | 5                       | -                       | 3                        | -                        |
| BTEX                | 47                   | 5                       | -                       | 3                        | -                        |
| PAH                 | 47                   | 5                       | -                       | 3                        | -                        |
| 15 Metals           | 47                   | 5                       | -                       | -                        | -                        |
| OC/OP<br>Pesticides | 1                    | -                       | -                       | -                        | -                        |

Sampling Quality Control Standards (AS4482):

a – One (1) in twenty (20) intra laboratory split (duplicate) samples

b – One (1) in twenty (20) inter laboratory split (triplicate) samples

c – Single rinse sample per piece of equipment per day

d – Single field blank per day.

The requirement for testing samples for soil physicochemical properties for obtaining threshold environmental investigation limits is presented in

Table 5. The potential requirement for soil physicochemical testing is summarised:

- Lead – no requirement
- Naphthalene – No requirement

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

**Table 5 Summary of Soil and Physicochemical Properties Required for Development of Ecological Investigation Levels - EIL's (NEPM 2013)**

| Compound     | Cation Exchange Capacity | pH | % Clay   |
|--------------|--------------------------|----|----------|
| Zinc         | Required                 |    | NR       |
| Copper       | Required                 | NR |          |
| Chromium III | NR                       |    | Required |
| Nickel       | Required                 | NR |          |
| Lead         | NA                       |    |          |
| Arsenic      | NA                       |    |          |
| DDT          | NA                       |    |          |
| Naphthalene  | NA                       |    |          |

NR - Soil physicochemical parameter not required to develop threshold investigation limit for compound

NA - Investigation limits dependent on land use scenarios rather than soil physicochemical properties

Given that a full 15 metal suite was analysed, there was requirement to assess the following soil physical properties:

- % Clay content;
- Cation exchange capacity; and
- Soil pH

The soil physical properties were assessed through estimation and chemical properties were based on knowledge of similar soil types encountered around Hobart.

Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018

### 3.2 Groundwater Assessment

#### 3.2.1 Monitoring Well Establishment and Testing

Groundwater wells were installed by KMR under the supervision of Scherzic on the 17<sup>th</sup> November 2014 to the 20<sup>th</sup> November 2014, see Figure 10. There are no records of slug testing or development.

#### 3.2.2 Monitoring Well Gauging and Sampling

Table 6 summarises wells that were gauged and sampled at the site at the site.

**Table 6 Summary of Monitoring Well Gauging and Sampling Procedures**

| Activity                      | Procedure Details   |
|-------------------------------|---|
| Groundwater Gauging           | All groundwater wells were gauged for standing water levels (SWL) from top of casing (TOC) and the presence of Phase Separated Hydrocarbons (PSH) using a Solinst water/oil/air Interface Probe (IP).   |
| Groundwater Extraction Method | Groundwater was extracted from the well using one of the following: <ul style="list-style-type: none"> <li>• Geoprobe peristaltic pump in cases where the well is shallower than 7 m; or a</li> <li>• Waterra valve in cases where the well is deeper than 7 m.</li> </ul>  |
| Groundwater Purging           | To ensure a representative groundwater sample could be collected, groundwater was purged three (3) times the volume of the well (6 x water column) or purged dry using the chosen groundwater extraction method for well development.<br>The following physiochemical parameters (PCP's) were monitored whilst purging to ensure that the aquifer and groundwater parameters had stabilised to within 10% variation of the previous reading: <ul style="list-style-type: none"> <li>• Reduction / Oxidation potential (REDOX);</li> <li>• Temperature;</li> <li>• pH; and</li> <li>• Electrical conductivity (EC).</li> </ul> |
| Decontamination Procedure     | Dedicated tubing was used at each monitoring well. All reusable equipment (IP) was decontaminated using Quantum Clean Laboratory Detergent (R213) and deionized water between each monitoring event.  |
| Sample preservation           | Following groundwater purging, all groundwater samples were collected in laboratory supplied receptacles, labelled, chilled, and delivered with a COC to National Association of Testing Authorities (NATA) certified laboratories for analysis within the prescribed holding time.   |
| Sample holding times          | Sample holding times were within acceptable range (based on NEPM B3-2013) from collection to extraction.  |

#### 3.2.3 Groundwater Analysis

Primary and QC samples (excluding triplicates) were submitted to Analytical Laboratory Services (ALS) for analysis. Table 7 presents a summary of the sample analysis including the QC sampling based on AS5667.1 and AS5667.11.

**Table 7 Overview of Groundwater Analysis and Quality Control**

| Analytes  | Primary Groundwater Samples | Duplicates <sup>a</sup> | Triplicate <sup>b</sup> | Rinse Blank <sup>c</sup> | Field Blank <sup>d</sup> | Trip Blank <sup>e</sup> |
|-----------|-----------------------------|-------------------------|-------------------------|--------------------------|--------------------------|-------------------------|
| TPH/TRH   | 4                           | 1                       | -                       | 1                        | -                        | 1                       |
| BTEX      | 4                           | 1                       | -                       | 1                        | -                        | 1                       |
| PAH       | 4                           | 1                       | -                       | 1                        | -                        | 1                       |
| 15 Metals | 4                           | 1                       | -                       | 1                        | -                        | 1                       |

a – One (1) in ten (10) intra laboratory split (duplicate) samples

b – One (1) in ten (10) inter laboratory split (triplicate) sample

c – Single rinse sample per piece of equipment per day

d – Single field blank per day.

e – One per esky (applicable to the August 2017 event only)

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018***4 QUALITY CONTROL**

Field and laboratory quality control results are presented in Appendix 3.

**4.1 Field**

It is standard to expect up to 10% error in field duplication and up to 10% laboratory error. Therefore, in theory up to 20% error can be assumed on duplicate analysis. Some variation may exist in soil and groundwater because even though all efforts are made to split samples homogeneously, fragments of materials may bias samples in certain elements.

Relative Percentage Differences (RPDs) for the duplicate and triplicate samples where applicable are calculated using the method outlined below.

The acceptance criteria used for the RPDs depend on the levels of contaminants detected and the laboratory's Method Detection Limits. The closer the levels detected are to the MDL the greater the acceptable RPD.

- RPDs are calculated as follows:
- RPD <50% for low level results (<20 \* MDL)
- RPD <30% for medium level results (20-100 \* MDL)
- RPD <15% for high level results (>100 \* MDL)
- No limit applies at <2 \* MDL (Method Detection Limit)

Field QA/QC procedures and compliance are summarised in Table 8 and Table 9.

**Table 8 Field QA/QC Procedures and Compliance for the Soil Investigations (March 2016 & August 2017)**

| QA/QC Requirement  | Completed    | Comments   |
|--|--------------|--|
| Appropriate sampling strategy used and representative samples collected  | Yes          | Sampling program was undertaken in accordance with AS4482.1-2005   |
| Field instruments calibrated   | Yes          | Certificates Provided Appendix 4   |
| Appropriate and well documented sample collection, handling, logging, transportation and decontamination procedures. | Yes          | None   |
| Chain-of-custody documentation completed   | Yes          | All samples were transported under strict COC procedures and signed COC documents are included in this report. |
| Required number of duplicate samples collected (1:20)  | Yes          | Soil - 47 Primary samples and 5 Dups   |
| QA/QC samples reported method detection limits within indicated guidelines.  | Yes          | All soil analytes comply with MDL method.  |
| Required numbers of field and rinse blank samples collected  | Rinsate only | Two rinsate blank collected as per AS4482.1-2005   |
| Acceptable field and rinse blank samples collected   | Yes          | All results were below laboratory limit of reporting.  |
| Samples delivered to the laboratory within sample holding times and with correct preservative                        | Yes          | All samples were sent to the laboratory within holding times and correct preservative.                         |

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

**Table 9 Field QA/QC Procedures and Compliance for the Groundwater Investigations (March 2016 & August 2017)**

| QA/QC Requirement  | Completed    | Comments   |
|--|--------------|--|

## 5 FIELD INVESTIGATION FINDINGS

### 5.1 Soil

#### 5.1.1 Geological Interpretation

The geology of the site is summarised in Table 12 and Table 13. Borehole logs are presented in Appendix 5. The site lithology is highly varied and comprises of predominantly clay, sand and gravel with some silt. All investigation bores intercepted predominantly fill material which has a very similar composition to the MRT mapped geology, indicating that it may have been locally reworked.

**Table 12 Generalised Stratigraphy at the Site TH01-BH13, March 2016**

|      | Bitumen  | Concrete   | Fill    | Fill Composition           | Natural Sediments | Natural Composition      | Comments           |

### 5.1.2 Soil Contamination Observations

Soil samples selected for hydrocarbon analyses were based on olfactory observations. Photo Ionisation Detector (PID) was used to assess soil contamination on site. All samples from the March 2016 assessment returned a value of 0.0ppm except for two samples from BH10 which recorded the following;

- 43ppm (parts per million) from 2.1m below ground surface (bgs); and
- 121ppm from 3.4m bgs

The samples from the August 2017 assessment returned a value of 0.1-2.3ppm.

## 5.2 Groundwater

### 5.2.1 Borehole Hydrogeology & Well Construction

Table 14 presents a summary of the groundwater monitoring well construction details for all wells at the site.

Details of the specific well install have not been made available to GES. GES have made assumptions about the screened intervals by indicating that the measured well depth is the base of the screened interval and the top of screened interval is roughly 1.5 m bgs as indicated in the text although this has not been confirmed. There is therefore an assumption that the wells have been correctly installed with the top of well screen at the depth water was struck (DWS) in a confined setting and above the DWS in an unconfined setting. If this assumption is correct and there is light non-aqueous phase liquids (LNAPL) within the groundwater, then this would be gauged during the Groundwater Monitoring Event (GME).

**Table 14 Summary of Well Construction and Aquifer Details (depths m bgs)**

| Well   | Date Installed | DWS (m)   | Top of Screen (m) | Bottom of Screen (m) | Aquifer Lithology at DWS* | Confined/Unconfined |

DWS - Depth Water Struck

^ Estimated from SWL and assumes an unconfined aquifer

Environmental Site Assessment – Version 8 – 2 Collins Street. 26 July 2018

### 5.2.2 Hydraulic Gradient and Groundwater Flow Direction

Field results from the groundwater gauging are presented in Appendix 6. Given the site was active, a vehicle obstructing 7116-1 meant that gauging and water quality information could not be collected.

Groundwater depths for the gauging events, March 2016 and August 2017 are presented in Table 15. Top of casing elevations have been inferred based on the PDA survey, and an assumption is made that all wells are installed at a consistent depth, m bgs. Survey information is not available for 7116-4 which is installed on the lower level within the building and therefore this data is not included for groundwater contouring. Phase Separated Hydrocarbons (PSH) was not detected (gauged) in any of the monitoring wells during either monitoring event. Groundwater levels from the March 2016 event have been contoured in Figure 11. The August 2017 event has not been contoured given missing gauging data from 7116-2 and survey data from 7116-4.

**Table 15 Summary of Groundwater Gauging Results, April 2016 and August 2017**

| Monitoring Well                                   | 7116-01       | 7116-02 | 7116-03 | 7116-04 | 7116-05 |
|---|---------------|---------|---------|---------|---------|
| Well Depth (m)                                    | 5.49          | 3.48    | 3.93    | 6.31    | 6.40    |

- Data not collected

? TOC unknown, unable to calculate corrected groundwater elevation

Results from the March 2016 assessment indicate that the groundwater flow direction is inferred to be radial towards 7116-03 which is screened within the sand and clay fill to the side of the former Hobart Town Rivulet. Groundwater flows to the north in zones D, E & F and to the southwest in zones A and B. The hydraulic gradient is determined to be approximately 0.4% towards the former Hobart Town Rivulet from the southern parts of the site and 0.3% towards the former Hobart Town Rivulet from the northern parts of the site (Table 16).

**Table 16 Summary of Inferred Site Groundwater Flow Directions and Rates**

| Details                                  | Zone A & B           | Zone D to F          |
|--|----------------------|----------------------|
| Groundwater flow direction from the site | Southwest            | North                |
| <i>Hydraulic Gradient Calculations</i>   |                      |                      |
| Up gradient Groundwater Elevation        | 0.550 m AHD          | 0.525 m AHD          |
| Downgradient Groundwater Elevation       | 0.475 m AHD          | 0.475 m AHD          |
| Distance Between Points                  | ~25 m                | ~13 m                |
| Hydraulic Gradient                       | 0.3 % (very shallow) | 0.4 % (very shallow) |

There is a possibility that groundwater may be migrating along the old rivulet sediments towards the new Hobart Rivulet alignment. Given a 1 m column thickness and a 10 m channel width, flow into the channel would range from 0.15 to 0.8 cubic meters per day (1.5 to 10 ml per second). If the site surfaces are removed, the groundwater gradient has the potential to steepen by 10-fold through mounding (3 to 4%).

In the context of any potential contaminant mass loading into the Hobart Rivulet. Existing groundwater flow rates are a significant magnitude lower in the order of milliliters per second compared with several cubic meters per second. Contaminant concentration threshold exceedances must be greater than 1,000,000 for mass loading equivalents to be detected within the Hobart Rivulet environment based on current setting and 10,000 magnitudes based on site excavation conditions.

Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018

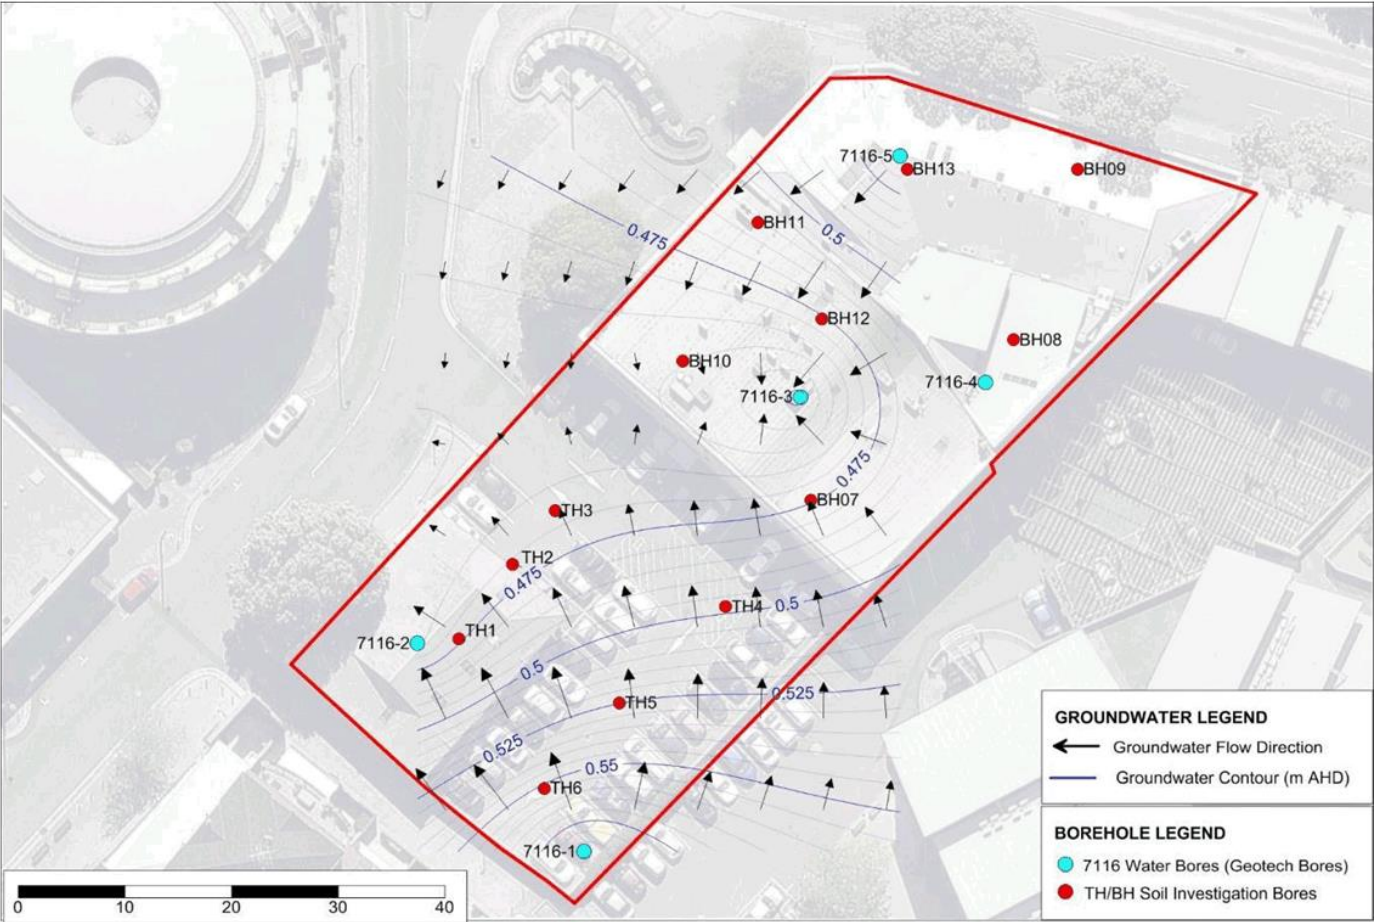

Figure 11 Groundwater Flow Direction, April 2016 Assessment

Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018

### 5.2.3 Hydraulic Conductivity

Slug testing has not been conducted in aquifers at the site and inferences are made about the aquifer material hydraulic properties. The aquifer is inferred to comprise of a *medium grained clean sand* which would have a hydraulic conductivity in the order of *1 to 5 m per day* (Freeze & Cherry 1979).

### 5.2.4 Groundwater Flow Rates

Groundwater flow rates are in the order of 5 to 22 m per year for zones A & B and 6 to 29 m per year for Zones D to F based on hydraulic calculations presented in Table 17. Groundwater flow rates relatively slow.

Table 17 Summary of Inferred Groundwater Flow Rates at the Site

| Applicable Areas | Hydraulic Conductivity (m/year) | Hydraulic Gradient | Effective Porosity | Flow rate (m/year)        |
|------------------|---------------------------------|--------------------|--------------------|---------------------------|
|                  | K                               | i <sub>h</sub>     | δ                  | (K x i <sub>h</sub> ) / δ |
| Zone A & B       | 365 to 1825                     | 0.003 (0.3%)       | 0.25               | 5 to 22                   |
| Zone D to F      | 365 to 1825                     | 0.004 (0.4%)       | 0.25               | 6 to 29                   |

### 5.2.5 Groundwater Physiochemistry

For both groundwater monitoring events, all purge volumes were attained or the wells were pumped to three times the well volume or dry (which ever sooner) before collecting a representative sample for physiochemical analysis and laboratory analysis. Physiochemical parameters were collected whilst purging and a representative value for the aquifer is presented in Table 18 and Table 19.

The following observations were made during the April 2016 groundwater sampling:

- Groundwater well 7116-04 was purged dry.
- Groundwater extracted from 7116-02 was turbid.

The following observations were made during the August 2017 groundwater sampling:

- The following groundwater wells 7116-04 and 7116-05 were purged dry.

Table 18 Summary of Stabilised Groundwater Properties, March 2016

| Parameter  | Range                            | Average | Comment  |
|------------|----------------------------------|---------|--|
| Temp (°C)  | 14.8 (7116-02) to 16.9 (7116-01) | 16.4    | Typical temperature for groundwater within southern Tasmania |
| pH         | 6.67 (7116-01) to 7.51 (7116-05) | 7.2     | Indicates near neutral pH conditions for groundwater         |
| Redox (mV) | -23 (7116-01) to 210 (7116-04)   | 103.9   | Indicates that oxidising conditions exist beneath the site   |
| EC (µs/cm) | 1281 (7116-05) to 5510 (7116-02) | 2687.2  | Indicates moderate to low quality groundwater                |

Table 19 Summary of Stabilised Groundwater Properties, August 2017

| Parameter  | Range                             | Average | Comment  |
|------------|-----------------------------------|---------|--|
| Temp (°C)  | 13.4 (7116-05) to 14.4 (7116-04)  | 13.8    | Typical temperature for groundwater within southern Tasmania |
| pH         | 6.92 (7116-02) to 7.74 (7116-04)  | 7.3     | Indicates slightly alkaline pH conditions for groundwater    |
| Redox (mV) | -0.9 (7116-02) to 240.1 (7116-05) | 142.3   | Indicates that oxidising conditions exist beneath the site   |
| EC (µs/cm) | 5.06 (7116-02) to 2095 (7116-03)  | 1284.3  | Indicates moderate to low quality groundwater                |

### 5.2.6 PSH & Groundwater Contamination Observations

PSH was not gauged in any wells at the site.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018***6 SOIL ECOLOGICAL ASSESSMENT****6.1 Protected Environmental Values**

The requirement for protecting soil from contaminated activities in Tasmania is managed under the Environmental Management and Pollution Control Act 1994 (EMPCA) which states in Part 5A:

(2) An area of land is a contaminated site if –

(a) there is in, on or under that area of land a pollutant in a concentration that –

(i) is above the background concentration; and

(ii) is causing or is likely to be causing serious or material environmental harm or environmental nuisance, or is likely to cause serious or material environmental harm or environmental nuisance in the future if not appropriately managed;

Potential soil impact at the site is assessed through application of the following environmental investigation guidelines.

**6.2 NEPM (2013) Guidelines**

The following environmental investigation guidelines are to be addressed in order to assess acceptable levels of risk to terrestrial ecosystems:

- NEPM (2013) Ecological Investigation Levels (EIL's) – have been developed for selected metal and organic substances. EIL's depend on specific soil and physicochemical properties and land use scenarios and generally apply to the top two (2) metres of the soil profile (NEPM 2013);
- NEPM (2013) Ecological Screening Levels (ESL's) – have been developed for selected petroleum hydrocarbon compounds and total petroleum hydrocarbon fractions. ESL's broadly apply to coarse and fine grained soils and various land use scenarios within the top two (2) metres of the soil profile (NEPM 2013).

Soil analytical results are compared against ESL's and EIL's limits presented in Table 20.

**Table 20 Summary of Soil Investigation Limits Considered at the Site based in NEPM (2013) ASC**

| Investigation Levels (IL) | Analytes Investigated |                |                       |                   |                          |              |              |
|---------------------------|-----------------------|----------------|-----------------------|-------------------|--------------------------|--------------|--------------|
|                           | Hydrocarbons          |                |                       |                   | Metals                   |              | DDT          |
|                           | BTEX                  | TRH (F1 to F4) | Benzo(a) pyrene (PAH) | Naphthalene (PAH) | Zn, Cu, Cr(III), Ni & As | Lead         |              |
| ESL's                     | Analysed              | Analysed       | Analysed              | No Guideline      | No Guideline             | No Guideline | No Guideline |
| EIL's                     | No Guideline          | No Guideline   | No Guideline          | Analysed          | Analysed                 | Analysed     | Not Analysed |

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

### 6.3 Guidelines

#### 6.3.1 Ecological Screening Levels

The following compounds were compared against NEPM (2013) ESL's:

- BTEX;
- F1 to F4 TRH; and
- Benzo(a)pyrene

Selection of ESL threshold investigation limits are set out in the NEPM (2013) guidelines and require classification of the soil according to:

- Land use sensitivity:
  - Areas of ecological significance
  - Urban residential and public open space; and
  - Commercial and industrial.
- Dominant particle size passing through a 2 mm sieve into:
  - Coarse – sand sizes and greater; and
  - Fine – clay and silt sizes.

Adopted NEPM (2013) soil and land use classifications are presented below.

#### 6.3.2 Ecological Investigation Levels

The following compounds were compared against EIL's:

- Lead;
- Nickel;
- Chromium;
- Zinc;
- Copper;
- Arsenic; and
- Naphthalene.

There was a requirement to classify the soil according to physicochemical properties given that the above listed compounds.

Selection of EIL threshold investigation limits are set out in the NEPM (2013) guidelines and require classification of the soil according to specific soil and physicochemical properties as detailed in the field investigation procedures and the adopted land use scenarios presented in Table 21.

**Table 21 Adopted Land Use Scenario for the Various Soil Bores**

| Land Use Scenario                     | Applicable Soil Bores       |
|---------------------------------------|-----------------------------|
| Areas of Ecological Significance      |                             |
| Urban Residential & Public Open Space |                             |
| Commercial & Industrial               | TH01 to TH06 & BH07 to BH22 |

### 6.4 Findings

#### 6.4.1 Ecological Screening Levels

##### March Results 2016

The findings from the March 2016 event indicate that ESL's were not exceeded in bores within Zone A & and Zone D and parts of Zone F.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

Table 22 (note this table has been amended from the comparison of HSL B guidelines to HSL D guidelines). The following ESL exceedance were apparent at the site in the March 2016 assessment:

- Benzo(a)pyrene concentrations exceeded the threshold ESL's in the following soil samples:
  - TH01: 0.4-0.8, 2.5-2.6; 4.2-4.5;
  - TH02: 0.4-0.8;
  - TH04: 0.5-0.6;
  - BH07: 0.54-0.5;
  - BH10: 0.4-0.5, 2.1-2.2 & 3.4-3.5;
  - BH11: 0.4-0.5 & 2.7-2.8; and
  - BH12: 0.3-0.4, 1.5-1.6 & 2.9-3.0.
- F2 concentrations exceeded the threshold ESL's in the following soil samples:
  - TH01: 0.4-0.8 & 4.2-4.5; and
  - BH10: 3.4-3.5.
- F3 concentrations exceeded the threshold ESL's in the following soil samples:
  - TH01: 0.4-0.8; 4.2-4.5;
  - TH02: 0.4-0.8; and
  - BH07: 0.54-0.5;

Impact was primarily encountered in bores within (and not necessarily confined to) Zone B, C, E and the northern part of Zone F. Highest levels of contamination roughly correlate with areas where the fill is deepest.

Impact was not encountered in TH03, TH05, TH06, BH08, BH09 and BH13. The findings indicate that ESL's were not exceeded in bores within Zone A & and Zone D and parts of Zone F.

#### 6.4.2 Ecological Investigation Levels

Table 24 and Table 25 summarises samples that exceed EIL's for commercial and industrial setting at the site (highlighted). The following ESL exceedance were apparent at the site in the March 2016 event:

- Zinc concentrations exceeded the threshold EIL's in the following soil samples:
  - TH04: 0.4-0.6;
  - BH07: 0.4-0.5;
  - BH10: 3.4-3.5;
  - BH11: 0.4-0.5; and
  - BH12: 0.3-0.4 & 1.5-1.6
- Napthalene concentrations exceeded the threshold EIL's in the following soil samples:
  - BH10: 3.4-3.5;

Impact was primarily encountered in bores within (and not necessarily confined to) Zone B, C and E.

There were no EIL exceedences from the August 2017 sampling event.

## 7 SOIL HUMAN HEALTH ASSESSMENT

The main exposure pathways and methods for assessing short term health risk from contaminated soils are presented in Table 26. Vapour inhalation risk is addressed in the Health Screening Level section of this report.

**Table 26 Summary of Exposure Pathways and Preliminary (Tier 1) Methods for Assessing Exposure Risk**

| Exposure Scenario                                       | Contaminant Type               | Tier 1 Assessment Method            | Reference              |
|---|--------------------------------|-------------------------------------|------------------------|
| Vapour Inhalation<br>(Petroleum Vapour Intrusion – PVI) | Petroleum Hydrocarbons         | HSL's (addressed in PVI section)    | CRC CARE Tec Report 10 |
| Dermal Contact  |                                | HSL's                               |                        |
| Dust Inhalation   | Metals<br>PAH's                | Health Investigation Levels (HIL's) | NEPM (2013)            |
| Soil Ingestion  | Organochlorides<br>Phenols     |                                     |                        |
|   | Herbicides<br>Other Pesticides |                                     |                        |

### 7.1 Guidelines

#### 7.1.1 Land Classification

The CRC CARE guidelines have been referenced to ensure that the correct land use and density category has been adopted for the surrounding properties. Correct identification of land use and building density has implications for the application of threshold investigation limits for all exposure scenarios presented in Table 27. Aspects needing to be considered include:

- Whether or not the site is of sensitive land use such as a childcare center, preschool, primary school or aged care facility;
- The percentage of paved area to determine direct contact exposure risk; and
- Classification based on residential, recreational or commercial/industrial setting.

Although the setting is high density residential which fits with HSL B, as the future development plans for the site have commercial premises on the ground floor, it is classified as HSL D according to CRC CARE (2013) guidelines. The basis for this is limited chance for exposure to soil due to continuous paving and potential exposure to commercial workers during site development and future trenching works only.

**Table 27 Summary of Land Use Setting and Density for Determining Exposure Risk**

| Property         | Land Use Class | Land Use Density | Paved Area | Sensitive Land Use |
|------------------|----------------|------------------|------------|--------------------|
| 2 Collins Street | D              | High             | 100%       | No                 |

Table 28 summarises the properties in which the soil analytical results are expected to be relevant as well as the applicable land use class for defining the threshold limits.

**Table 28 Summary of Land Use Class Adopted for Defining Soil Analysis Threshold Limits**

| Soil Bores         | Relevant Properties | Adopted Land Use Class |
|--------------------|---------------------|------------------------|

Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018

**7.2 Findings****7.2.1 Dermal Contact - Petroleum Hydrocarbons**

Table 29 and Table 30 presents soil hydrocarbon analytical results compared against CRC CARE HSL D guidelines for assessing dermal contact risk. A ground floor commercial premises has been assigned HSL D. The dermal contact risk is acceptable according to all land use guidelines.

**Table 29 Soil Analytical Results Compared Against CRC CARE Guidelines for Dermal Contact (March 2016)**

| CRC CARE Health Screening Level<br><br>Dermal Contact Hazard from Soil Hydrocarbons |               |           | EP080: BTEXN |         |              |               |             | EP080/071: TRH    |                     |                     |                     |

### 7.2.2 Dust Inhalation & Soil Ingestion

Combined dust inhalation and soil ingestion risk is assessed through the application of NEPM (2013) HIL's for exposure to soil contaminants.

Soil analytical results are compared against the HIL's presented in Table 31 and Table 32. The adopted guideline is HIL D for commercial use with limited scope for exposure to soil impact (CRC CARE 2013). The following HIL D exceedances for a commercial setting were apparent at the site:

- Benzo(a)pyrene concentration exceedances in the following soil samples:
  - TH01: 0.4-0.8 & 4.2-4.5;
  - BH07: 0.4-0.5;
  - BH10: 3.4-3.5; and
  - BH11: 0.4-0.5.
- Lead concentration exceedances in the following soil samples:
  - BH18: 0.5-0.6.

Potential dust inhalation and soil ingestion risks are apparent in (but not necessarily confined to) Zone B, C & E.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

**Table 31 Summary of Analytical Results Compared Against HIL D (March 2016)**

| NEPM Health Investigation Levels  |               | Arsenic | Beryllium | Cadmium | Chromium Total | Cobalt | Copper | Lead  | Manganese | Nickel | Vanadium | Zinc   | Mercury | PAHs  | Benzo(a)pyrene TEQ (WHO) |
|-----------------------------------|---------------|---------|-----------|---------|----------------|--------|--------|-------|-----------|--------|----------|--------|---------|-------|--------------------------|

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018***8 GROUNDWATER ENVIRONMENTAL AND HEALTH ASSESSMENT****8.1 Protected Environmental Values**

The quality of groundwater in Tasmania is managed under the SPWQM which is an acronym for the State Policy on Water Quality Management 1997 (DPIWE, 1997) ('the State Policy'). The stated purpose of the State Policy is to:

“achieve the sustainable management of Tasmania's surface water and groundwater resources by protecting or enhancing their qualities while allowing for sustainable development in accordance with the objectives of Tasmania's Resource Management and Planning System.”

The State Policy defines a range of Protected Environmental Values (PEVs) for surface and groundwater, which are uses of the water resource that are to be protected. For groundwater, PEVs are allocated based upon the salinity (concentration of total dissolved solids) of the groundwater. The lower the salinity, the greater the number of uses (PEVs) that are likely to apply to the groundwater body.

The Environmental Protection Authority (EPA) considers that groundwater is polluted where current and / or future PEVs for the relevant segment are precluded. PEVs of groundwater are considered to be precluded when the allocated groundwater quality objectives for those PEVs have been exceeded.

The State Policy defines a range of PEV's on the basis of groundwater salinity. Groundwater electrical conductivity (EC) is used as a basis in which to assess total dissolved solid (TDS) concentrations at the site through a conservative ratio of 1 mg/L TDS to 0.75 µS/cm EC.

Based on the previous groundwater monitoring event, EC at the site ranges from 1281 to 5510 µS/cm which approximately translates to a TDS concentration at the site ranging from 960 milligrams per litre (mg/L) (7116-05) to 4132 mg/L (7116-02) with an average value of 2015 mg/L.

Groundwater beneath the site generally falls within Category B when classified according to the State Policy. The environmental values requiring protection are presented in Table 33.

**Table 33 Environmental Values and Uses of Groundwater Requiring Protection (State Policy on Water Quality Management 1997).**

| Protected Environmental Value | PEV Based on TDS Concentrations (mg/L) |             |              |                    |
|-------------------------------|--|-------------|--------------|--------------------|
|                               | A                                      | B           | C            | D                  |
|                               | Less than 1000                         | 1000 – 3500 | 3500 – 13000 | Greater than 13000 |

Note: Blue Shading Indicates Protected Environmental Value Requirement

**8.2 Guidelines****8.2.1 Drinking Water**

The State Policy recommends that guidelines for the protection of human health be sourced from the National Health and Medical Research Council (NHMRC). The NHMRC in collaboration with the Natural Resource Management Ministerial Council (NRMCC) published the 2011 Australian Drinking Water Guidelines (ADWG). The ADWG's are reiterated in the NEPM (2013) are considered the most recent guideline for drinking water quality in Australia and have been adopted for this investigation.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

### **8.2.2 Irrigation**

The following guideline would normally be adopted at the site:

- Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC) and Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ), 2000 (ANZECC, 2000) - Water Quality for Irrigation and General Water Use.

For irrigated waters, guidelines are available for heavy metals but not for hydrocarbons.

### **8.2.3 Industrial Water Use**

No relevant guidelines are available for industrial water use.

### **8.2.4 Stock Watering**

The following guidelines are to be adopted at the site:

- Australian and New Zealand Guidelines for Fresh and Marine Water Quality. Australia and New Zealand Environment and Conservation Council and Agriculture and Resource Management Council of Australia and New Zealand, 2000 (ANZECC, 2000) - Livestock Drinking Water Quality: Recommended water quality trigger values (low risk) for heavy metals and metalloids in livestock drinking water.
- For organic contaminants the ANZECC (2000) guideline recommends that drinking water guidelines for human health be adopted. Therefore the criteria for organic contaminants in groundwater for livestock drinking are taken from ADWG 2011.

### **8.2.5 Ecosystem Protection**

The State Policy recommends adopting the following guideline:

- Australian Water Quality Guidelines for Fresh and Marine Waters, (ANZECC, 1992) and Agriculture and Resource Management Council of Australia and New Zealand.

A more recent version of this publication has been released:

- Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZECC 2000).

The ANZECC 2000 guidelines are reiterated as Australian Water Quality Guidelines (AWQG's) in NEPM (2013) and are considered the primary reference guideline in this investigation for all PEVs other than drinking water.

## **8.3 Relevant PEV's**

Environmental receptors are summarised in Table 34.

**Table 34 Summary of Potential Environmental Receptors at the Site**

| Protected Environmental Value | Potential Pathway | Details   |
|-------------------------------|-------------------|---|
| Drinking Water                | No                | Drinking Water is Not a PEV at the Site   |
| Irrigation                    | No                | Groundwater irrigation bores are used locally at five (5) locations within 70 m of the site.  |
| Industry                      | No                | There is no industry downgradient of the site   |
| Stock Watering                | No                | There is no stock watering downgradient of the site   |
| Ecosystem Protection          | Yes               | Victoria Dock waterline is located 220 m to the south of the site. This is the primary environmental receptor downgradient of the site. |

The main receptors of potential concern to be investigated at the site include:

- Ecosystem Protection.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

## 8.4 Ecosystem

### 8.4.1 Receptors

The localised receptor is expected to be Victoria Dock which is located at the exit point of the previous onsite stream (Figure 12). There is the possibility that groundwater may migrate towards the new Hobart Rivulet alignment (through leaky infrastructure).

An assessment has been conducted on the quality of groundwater within the Hobart Rivulet and the Derwent River. Heavy metal concentrations have largely improved in both the settings. Historically in the 1980's concentrations were more consistent with ANZECC guideline 80% species protection limits.

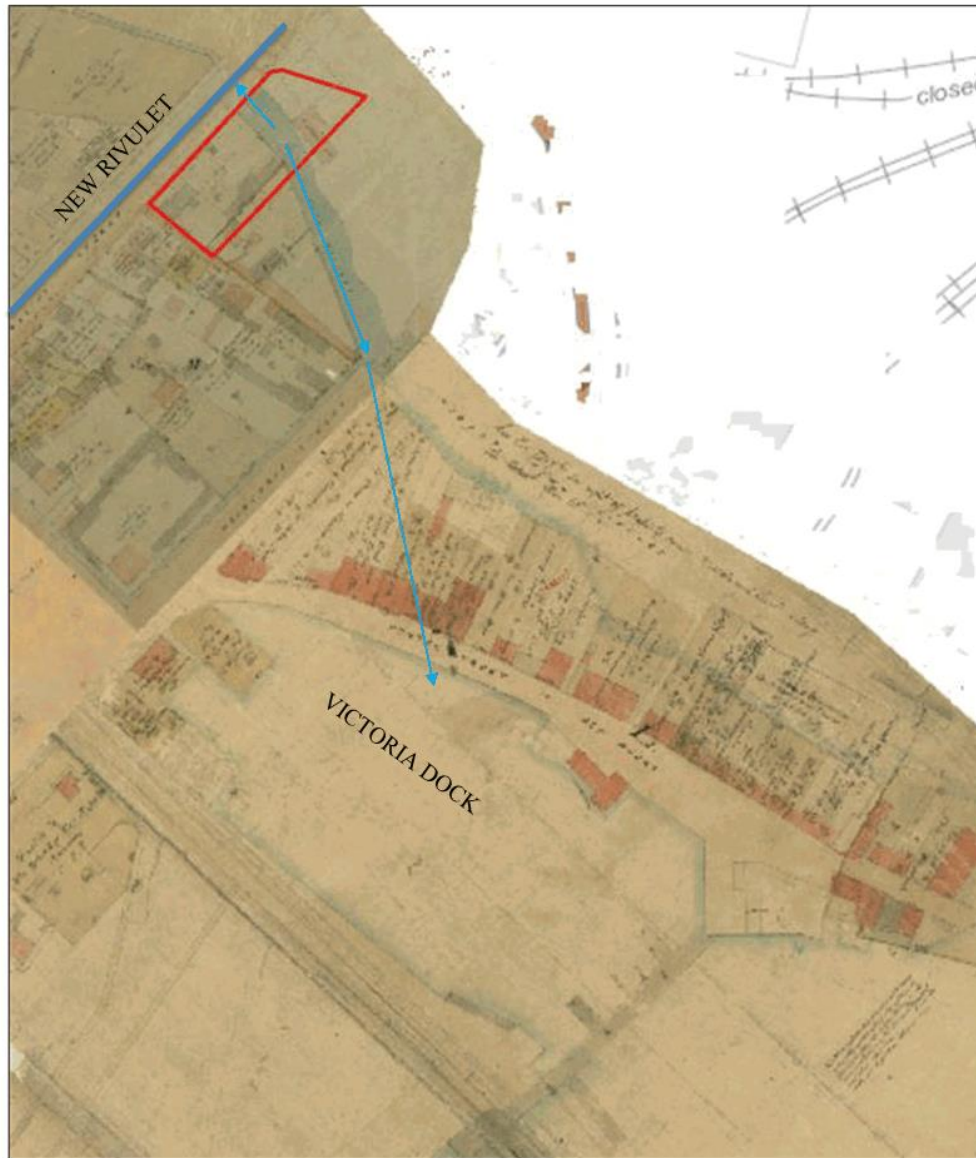

Figure 12 Likely groundwater migration pathway from the site along the original stream channel.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

Typical concentrations with the Hobart Rivulet and the Derwent River nowadays are more consistent with 90% species protection with the following typical values/ranges:

- Mercury – 0.1 ug/L in Derwent River (Chapman 1992) with ANZECC 90% protection at 0.7 ug/L
- Copper – 5 ug/L in Hobart Rivulet (DEP 2011) with ANZECC 90% protection at 3 ug/L
- Lead – 5 ug/L with common 10 ug/L in Hobart Rivulet (DEP 2011) with ANZECC 90% protection at 6.6 ug/L
- Zinc – 50 ug/L in Hobart Rivulet (DEP 2011) with ANZECC 90% protection at 23 ug/L

The groundwater results are to be compared against ANZECC (2000) 90% species protection guideline limits. This same guideline should apply to surface waters at the site. It has been established that threshold limit exceedances must be 10,000 over the limit for groundwater impact to the Hobart Rivulet be of concern. Perhaps a greater risk is the chance that surface waters will mobilise contaminants into the waterways.

#### 8.4.2 Findings

BTEX, Naphthalene and TRH groundwater analytical results were compared against March 2016 ANZECC (90%) guidelines presented in Table 35 to Table 37 and August 2017 ANZECC (90%) presented in Table 38 to Table 40.

There were no PAH or TPH exceedances in groundwater collected from sampled wells in either groundwater monitoring event.

Metal concentrations in groundwater were exceeded in groundwater collected during the March 2016 event in the following wells:

- Copper: 7116-04 & 7116-05;
- Zinc: 7116-04 & 7116-05; and
- Mercury: 7116-01 & 7116-04.

Metal concentrations in groundwater were exceeded in groundwater collected during the August 2017 event in the following wells:

- Copper: 7116-03, 7116-04 & 7116-05 which are right on the investigation limit of 0.003 ug/L;
- A single isolated occurrence of vanadium in 7116-04.

### 8.4.3 Exposure Pathways & Receptor Risks

There is a risk following site demolition works that surface water runoff may become impacted by residual contaminants within the fill and natural soils. Given the material predominantly comprises of clay, there is a higher chance that water will have the tendency to runoff rather than percolate. There is a possibility of contaminant leaching to the water table, but given the calculated mass loadings, contaminants must have particularly high concentrations for nearby ecosystems to be impacted by contaminant flushing. Long term effects are considered minor given greater chance for dilution from low groundwater flux into the receiving environment.

Surface waters at the site are the primary concern in terms of short term mass loading into the receiving environment via the stormwater system. Similarly, there is a risk that impacted surface waters and soil may mobilise into the neighboring sites (The Woolstore Apartment Carpark in particular). A contamination management plan (CMP) and subsequent soil and water management plan (SWMP) will need to be put in place to address this risk.

The main contaminants of concern from soil leaching (based on the soil assessment) include the following:

- BTEX;
- TPH;
- Naphthalene;
- Cadmium;
- Copper;
- Lead; and
- Possibly mercury.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

## **9 TRENCH WORKER PVI ASSESSMENT – HSL's**

### **9.1 Classification**

#### **9.1.1 Soil**

The following Health Screening Assessment is based on hydrocarbon vapour intrusion risk to subsurface excavation workers from hydrocarbon impacted soil. Soil HSL's for assessing hydrocarbon risk to maintenance workers are based on CRC CARE Technical Report 10 guidelines (Friebel & Nadebaum 2011) and the following variables:

- Dominant grain size class of material *at and below the soil sample depth* based on US Agriculture Soil Classification System (SCS) and partitioning into either sand, silt or clay; and
- Classifying soil according to depth ranges: 0 to 2 m; 2 to 4 m; 4 to 8 m; and greater than 8 m;

### **9.2 Findings**

#### **9.2.1 Soil**

Table 41 and Table 42 present the HSL vapour inhalation risk to trench workers. There were no HSL exceedances for vapour inhalation risk to trench workers.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

**Table 41 Summary of Soil Analytical Results Compared against HSL's for Intrusive Maintenance Workers March 2016**

## 10 INDOOR INHABITANT PVI ASSESSMENT – HSL's

The HSL assessment approach is generally the first investigation phase adopted for assessing PVI risk at petroleum hydrocarbon (PHC) impacted sites. HSL guidelines have been applied for samples collected from the site to account for risks that may be associated with volatile hydrocarbon vapour intrusion into confined spaces where there may be an inhalation risk through longer term exposure. This does not constitute a full vapour risk assessment but provides additional information from which to further quantify any risk.

A detailed investigation is recommended over an HSL assessment where an acute risk has been identified at the site (CRC CARE 2013) as a result of:

- Migrating product on surface soils beneath buildings;
- Strong PHC odors;
- Flammable risk in confined spaces; and/or
- Health complaints from occupants.

Based on the preliminary site visit, none of the above conditions have been identified at the site.

PVI risk is initially interpreted through the development of HSL threshold limits from the following classifications:

- The geology and or hydrogeology of the investigation point; and
- Land use sensitivity;

The resulting HSL threshold limits are compared with laboratory analytical results.

### 10.1 Land Use Class

For surrounding properties, the potential PVI risk is characterized through application of CRC CARE HSL's for each individual properties based on their existing land use (NEPM 2013; Friebe & Nadebaum 2010). The CRC CARE guidelines have been referenced to ensure that the correct land use and density category has been adopted for the surrounding land and to ensure health risks are consistent with the HSL models. Aspects considered include the:

- Sensitivity of the existing or potential land use;
- Percentage of paved area for defining potential vapour migration risk;
- *Type of ground floor car park which may influence the confinement of PHC vapors;*
- Presence of a slab or cavity for discerning vapour intrusion risk.

For proposed future land use, the following HSL's for commercial use are adopted for the site:

- HSL D for indoor commercial spaces located on the first floor.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

## 10.2 Selected Media for Assessing PVI Risk

Table 43 presents a summary of the preferred HSL approach to assessing PVI risk.

**Table 43 Preferred Methods for Determining Site PVI Risk**

| Media Analysed | Method  | Limitations  | Order of Preference |
|----------------|---|--|---------------------|
| Soil Gas       | Concentrations of a soil gas through a soil vapor probe                     | This approach provides the most reliable data in interpreting PVI risk, although direct modelling should be applied concentrations exceed HSL threshold limits.  | Primary             |
| Groundwater    | Concentrations of PHC in groundwater through deployment of monitoring wells | Determining PVI risk based on groundwater is inherently conservative when interpreting vapour risk to account for not readily discernable preferential pathways. Reference may be drawn to alternative assessment approaches:<br>1) Application of site specific conditions to the CRC CARE model for assessing PVI risk<br>2) Soil gas interpretation for areas where a PVI risk is identified from groundwater analysis. | Secondary           |
| Soil           | Concentrations of PHC in soil   | Concentrations in soil may be subject variability due to soil moisture, organic content and oxygen ingress all which create significant bias in threshold values. Reliance is place on utilizing groundwater analysis over soil.   | Tertiary            |

Onsite PVI risk is assessed through both soil and groundwater analytical results.

## 10.3 Soil

### 10.3.1 Guidelines

Soil HSL's are specific to each soil sample and involves characterisation based on the following variables:

- Land use class;
- Dominant grain size class of material *above the soil sample depth* based on US Agriculture Soil Classification System (SCS) and partitioning into either sand, silt or clay; and
- Classifying soil according to depth ranges: 0 to 1 m; 1 to 2 m; 2 to 4 m; and greater than 4 m;

CRC CARE Guidelines stipulate that the depth class used in the soil assessment needs to the depth of impacted soil below the habitable space. Given the proposed development will be built directly on ground level, as per CRC Care Guidelines (Friebel & Nadebaum 2011) a commercial (HSL D) setting has been adopted for:

- Commercial workers located on the ground floor of the building.
- The assessment has been conducted based on slab located directly on ground with absence of fill.

### 10.3.2 Findings

Soil sampling results (Certificate of Analysis) are presented in Appendix 7. Soil samples have been assessed against the elected NEPM (2013) health screening levels (HSL) to determine potential hydrocarbon vapour risks to site users.

There are no Tier 1 PVI HSL exceedances for assessing indoor vapour intrusion risk to residents within the building and commercial workers on the ground floor level (Table 44 & Table 45).

### 10.3.3 Receptor Risk

Receptors identified in this HSL assessment are based on long term vapour intrusion into confined habitable spaces such as commercial premises in this setting. Given that there were no Tier 1 HSL D exceedances, there is a low risk of vapour intrusion into commercial ground floor level spaces.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

## 10.4 Groundwater

### 10.4.1 Guidelines

Concentrations of hydrocarbons in groundwater have been assessed against NEPM (2013) HSL's to determine potential risk to indoor receptors located at ground level only. Given there is no proposal for a basement, a groundwater depth class of 2 m bgs is applicable given groundwater depth below site ground floor founding level.

Groundwater HSL's are specific to each monitoring well and involves characterisation based on the following variables:

- The HSL's for surrounding properties (already identified);
- The dominant grain class overlying the hydrocarbon impacted groundwater based on US Agriculture Soil Classification System (SCS) and partitioning into either sand, silt or clay; and
- A depth class range is selected in accordance with the depth at which hydrocarbon impacted groundwater was intercepted (the closest DWS to the high PID reading). Classifying soil according to depth ranges: 0 to 1 m; 1 to 2 m; 2 to 4 m; and greater than 4 m;

Table 46 presents a summary of the principle lithologies intercepted above the water table (vadose zone) in each bore indicating the potential for vapour phase intrusion. Resulting threshold values for addressing HSL's are presented in the groundwater analytical results section of this report.

The highest PID values and the depth at which DWS are used as a reference point from which to interpret the dominant soil type in the vadose zone above the hydrocarbon impacted aquifer.

**Table 46 Summary of Vadose Zone Lithology (above hydrocarbon impacted aquifer) based on USCS System**

Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018

**10.4.2 Findings**

Groundwater sampling results Certificate of Analysis is presented in Appendix 7. Groundwater has been assessed against the elected NEPM ASC health screening levels (HSL) to determine potential hydrocarbon vapour risks to site users (Table 47 and Table 48).

Hydrocarbons have not been detected in any of the groundwater samples collected from either groundwater monitoring event.

**Table 47 Summary of Groundwater Samples That Exceeded Threshold HSL Limits (March 2016)**

#N/A - Requires alternative assessment approach if PHC identified ie. soil vapour assessment

NL – Non Limiting applicable as any derived HSL will exceed analyte solubility limit

**10.4.3 Receptor Risk**

A risk to indoor receptors from PVI from hydrocarbon impacted groundwater is not apparent based on the investigation. GES have not identified any soil with hydrocarbon impact which exceeds HSL guideline limits. The second phase of investigation around the apparent UST's (of which have not been located as yet) did not reveal any HSL exceedance in soil at a shallow depth or near the water table indicating an unlikely occurrence within the groundwater. This has been confirmed in the groundwater monitoring event, in which there are no HSL exceedances for assessing PVI risk to indoor receptors.

Analytical results and the extensive soil sampling indicate there is a very low chance of intercepting volatile hydrocarbon impact within soil at the site. This may be attributed to either:

- Predominance of heavy chain fuels (diesel and kerosene) used at the site; and
- Biodegradation of lighter hydrocarbon fractions which is consistent with the age of the tanks which are thought to exist at the site.

Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018

**11 SOIL DISPOSAL ASSESSMENT****11.1.1 Guidelines**

Soil which is excavated from the site for landfill disposal is to be assessed against Information Bulletin 105 (IB105) for Classification and Management of Contaminated Soil for Disposal. The EPA uses 4 categories to classify contaminated soil as per Table 49:

- (Level 1) Fill Material;
- (Level 2) Low Level Contaminated Soil;
- (Level 3) Contaminated Soil; and
- (Level 4) Contaminated Soil.

Fixed numerical values are presented for soil concentrations and leachable fraction concentrations.

**11.1.2 Findings**

The soil samples have been compared against IB105 guidelines for soil disposal, refer to Table 50. The following conclusions have been made;

- Exceedances of barium, cadmium, copper, lead, manganese, mercury and zinc have been detected up to Level 2 however when these metal concentrations are averaged the soil is reduced to level 1 classification.
- Exceedances of lead have been detected up to Level 3 however when these metal concentrations are averaged the soil is reduced to level 1 classification.
- Exceedances of B(a)p, and the Sum of PAHs have been detected up to Level 4 however when these analyte concentrations are averaged the soil is reduced to level 3 classification.
- Exceedances of TRH (C<sup>10</sup>-C<sup>36</sup>) have been detected to Level 3 however when these metal concentrations are averaged the soil is reduced to level 2 classification.

Given the variation in soil classification across the site, GES recommends that all soil excavated at the site is stockpiled systematically, tested for contamination levels and transported to a licensed storage and handling facility for managing contaminated soil.

Table 49 Summary of IB105 Classification Guidelines

|  | Classification<br>(with reference to Table 2)  | Controlled<br>Waste <sup>1</sup> | Comments   |
|--|--|----------------------------------|--|
| <b>Fill Material<sup>2</sup><br/>(Level 1)</b>         | Soil that exhibits levels of contaminants below the limits defined under <i>Fill Material</i> in Table 2.  | Unlikely                         | Soil classified as <i>Fill Material</i> can still be a 'pollutant' under the <i>Environmental Management and Pollution Control Act 1994</i> and needs to be responsibly managed.   |
| <b>Low Level Contaminated Soil<br/>(Level 2)</b>       | Soil that exhibits levels of contaminants above the limits defined under <i>Fill Material</i> but below the limits defined under <i>Low Level Contaminated Soil</i> in Table 2.  | Likely                           | Where leachable concentrations have not been prescribed, maximum total concentrations will be used to classify the soil.   |
| <b>Contaminated Soil<br/>(Level 3)</b>                 | Soil that exhibits levels of contaminants above the limits defined under <i>Low Level Contaminated Soil</i> but below the limits defined under <i>Contaminated Soil</i> in Table 2.  | Yes                              | Where leachable concentrations have not been prescribed, maximum total concentrations will be used to classify the soil.   |
| <b>Contaminated Soil for Remediation<br/>(Level 4)</b> | Soil that exhibits levels of contaminants above the limits defined under <i>Contaminated Soil</i> in Table 2 (regardless of the maximum total concentrations) is generally <b>not</b> considered acceptable for off-site disposal without prior treatment. | Yes                              | Soil that contains contaminants that do not have criteria for leachable concentrations (e.g. petroleum hydrocarbons), and the levels of contaminants exceed the maximum total concentrations listed in <i>Contaminated Soil</i> , are generally classified as <i>Contaminated Soil for Remediation</i> . |

<sup>1</sup> Controlled Waste is defined in the *Environmental Management and Pollution Control Act 1994*.

<sup>2</sup> Criteria for *Fill Material* are the limits set by the Director for the purposes of R.9(2)(a)(ii) in the *Regulations*.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

## **12 CONCEPTUAL SITE MODEL**

### **12.1 Overview of Impacts**

A conceptual model has been generated for the site illustrating the main source, transport, exposure media and receptors identified at the site. The greatest risk is present in Zone C and Zone E and potentially at depth in Zone B. These areas are the locations where the fill is expected to have been dumped into the historical Hobart Town Rivulet channel, refer to Figure 7. Receptor risks identified at the site include:

- Trench worker dust inhalation or soil ingestion risk to PAH compounds and lead in soil;
- Trench worker inhalation of volatilized ambient PHC's from residual hydrocarbons within UST's which may be excavated/uncovered during site foundation works; and
- Ecological Receptor risk via Groundwater transport of heavy metals and UST leaching.

### **12.2 Potential & Identified Sources of Contamination**

#### **12.2.1 Potential Primary Sources**

The primary potential sources of contamination impact at the site includes:

- UST T1, T2, T3 and T4 and associated bowsers and fuel lines;
- Tanning operations in zone B & C;
- Historical garage/tram workshop in zone D & E;
- Soap and candle making in zone F; and
- Infilling of the former Hobart Town Rivulet in Zone C and potentially at depth in zone B.

There may be other unknown potential sources of onsite or offsite impact (outside of the sampling areas) which GES are unaware of and therefore have not been investigated within this assessment.

Contaminates of potential concern associated with these potential sources have already been identified in a previous section.

#### **12.2.2 Identified Secondary Sources**

The exact source of the impact is not known. The following contaminants have been identified:

- PAH, from an unknown origin, but occurring either from PAH impacted fill which is common in the area or historical site use as a vehicle service center where PAH containing fuels or oils may have been used and where gasworks waste may have been dumped; and
- Heavy metals within the fill (primarily lead).

### **12.3 Potential Receptors**

The following presents a summary of all potential receptors considered in the assessment.

#### **12.3.1 Potential Waterway/River Impact**

GES have identified that the site does not present a risk to drinking water quality given that groundwater has been ruled out as a PEV based on high salinity. Other PEV's including industrial use, stock watering and irrigation have been ruled out leaving ecosystem as a PV which needs to be considered.

In its current use, there is a low risk that the flagged soil EIL's and EIL's exceedances will present a risk to the receiving ecosystem receptor – being Victoria Dock downgradient of the former Hobart Town Rivulet alignment and potentially Hobart Rivulet. Groundwater results from both monitoring rounds indicate exceedances for heavy metals but not PAH's. It is possible that the heavy metal impact identified in groundwater at the site sources from upgradient.

It is unlikely that groundwater will impact stormwater within the now enclosed Hobart Rivulet given the calculated likely mass loading rates.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

### 12.3.2 Potential Future Onsite Receptors

Potential future onsite receptors including slab demolition, earth removal, development and occupancy stages. Receptors therefore include ground floor commercial workers and above ground residence.

Potential future onsite receptors are presented in Table 51.

**Table 51 Summary of Potential Future Onsite Receptors**

| Medium      | Specific Onsite Receptor   |
|-------------|--|
| Soil Impact | Future site commercial workers involved soil removal – redevelopment phase   |
|             | Future trench workers – ongoing – limited to excavations greater than 1m bgs |
|             | Future onsite inhabitants - ground floor commercial workers                  |

### 12.3.3 Excluded Receptors

There is a low risk that groundwater will present a health concern to site workers unless it has been mixed with shallow impacted fill material.

### 12.3.4 Potential Offsite Receptors

The chance of PAH and possibly heavy metal dispersal from the site is largely dependent on how the site redevelopment work is managed. Heavy metals and PAH compounds are not expected to concentrate further but may be mobilized particularly within surface waters during storm events. Table 52 presents a summary of potential offsite receptors

**Table 52 Summary of Potential Offsite Receptors**

| Medium                                | Specific Offsite Receptor  |
|---------------------------------------|--|
| Shallow Soil & Surface Water Drainage | Public and residential receptors downgradient of the site – during development only.         |
| Soil/groundwater                      | Ecological receptors – leaching & surface water/soil runoff – Victoria Dock – River Derwent. |

## 12.4 Transport Mechanisms and Exposure Routes

### 12.4.1 Incomplete Contaminant Exposure Pathways

Incomplete contaminant exposure pathways relate to present unmanaged risk. Table 53 presents a summary of potential receptors identified with incomplete exposure pathways deducted based on site desktop assessment or soil analysis. Exposure pathways ruled out are risk to future site commercial users given no HSL D vapour intrusion exceedances have been identified (from both groundwater and soil analysis) and limited opportunity for access to impacted soil beneath ground level new clean imported fill and the slab.

**Table 53 Summary of Incomplete Contaminant Exposure Pathways**

| Medium | Specific Receptor                            | Pathways Ruled Out                                  | Basis   |
|--------|--|---|---|
| Soil   | Future site habitants - commercial receptors | Vapour Inhalation                                   | No HSL exceedances in soil  |
|        | Future site habitants - commercial receptors | Dermal contact<br>Dust inhalation<br>Soil Ingestion | Limited opportunity for access to soil given 100% sealed ground at floor level. |

*Environmental Site Assessment – Version 8 – 2 Collins Street. 26 July 2018*

#### 12.4.2 Potential Pathways

During site development works, potential transport mechanisms and exposure routes identified relating to human health include:

- Dust generation and specifically lead and PAH impacted soil being inhaled by onsite commercial workers and surrounding public/residential receptors;
- Impacted soil and impacted stormwater mobilization during storm events; and
- PAH and lead impacted soil being ingested.

During this phase, there is a potential pathway for shallow impacted soil (exceeding ESL's and EIL's) to enter the marine environment through the following pathways:

- Poor control of impacted surface soils/water eroding and washing into storm water network; and
- Direct leaching of impacted soil into the groundwater and into the marine environment along the former Hobart Town Rivulet alignment.

Similarly, during storm events, impacted soil and surface waters have the potential to migrate into neighboring properties.

Provided that a contamination management plan (CMP) is put in place, there is unlikely to present a risk and become a plausible contaminant exposure pathway. Specific recommendations pertaining to these risks have been compiled into a CMP document which is to accompany this document.

Following site development works, there may remain a low risk to trench workers if excavations are deeper than 1m bgs. Ongoing risks are attributed to soil ingestion and dust inhalation hazards; if a contamination management plan is adopted the risk will be mitigated.

Potential complete exposure pathways identified at the site are presented in Table 54.

**Table 54 Summary of Potential Complete Contaminant Exposure Pathways**

| Medium           | Specific Pathway                                    | Receptors                      |
|------------------|---|--------------------------------|
| Soil             | Soil removal – redevelopment phase                  | Future site commercial workers |
|                  | Soil removal – trench workers                       | Future trench workers          |
|                  | Dust generation from the site – redevelopment phase | Public receptors               |
| Soil/groundwater | Surface water/soil runoff                           | Ecological receptors           |
|                  | Leaching  |                                |

\* See Recommendations for Managed Risk Options

#### 12.4.3 Plausible Contaminant Exposure Pathway Details

Provided that the soil is adequately managed as indicated in the recommendations and the CMP, plausible exposure pathways to humans are not identified at the site.

Surface water/soil runoff may be managed at the site, provide appropriate engineering measures are put in place to limit erosion and discharge during a heavy rainfall event. Marine ecosystem impact has been identified as a plausible but low risk pathway given revised groundwater mass loading calculations, refer to Figure 13.

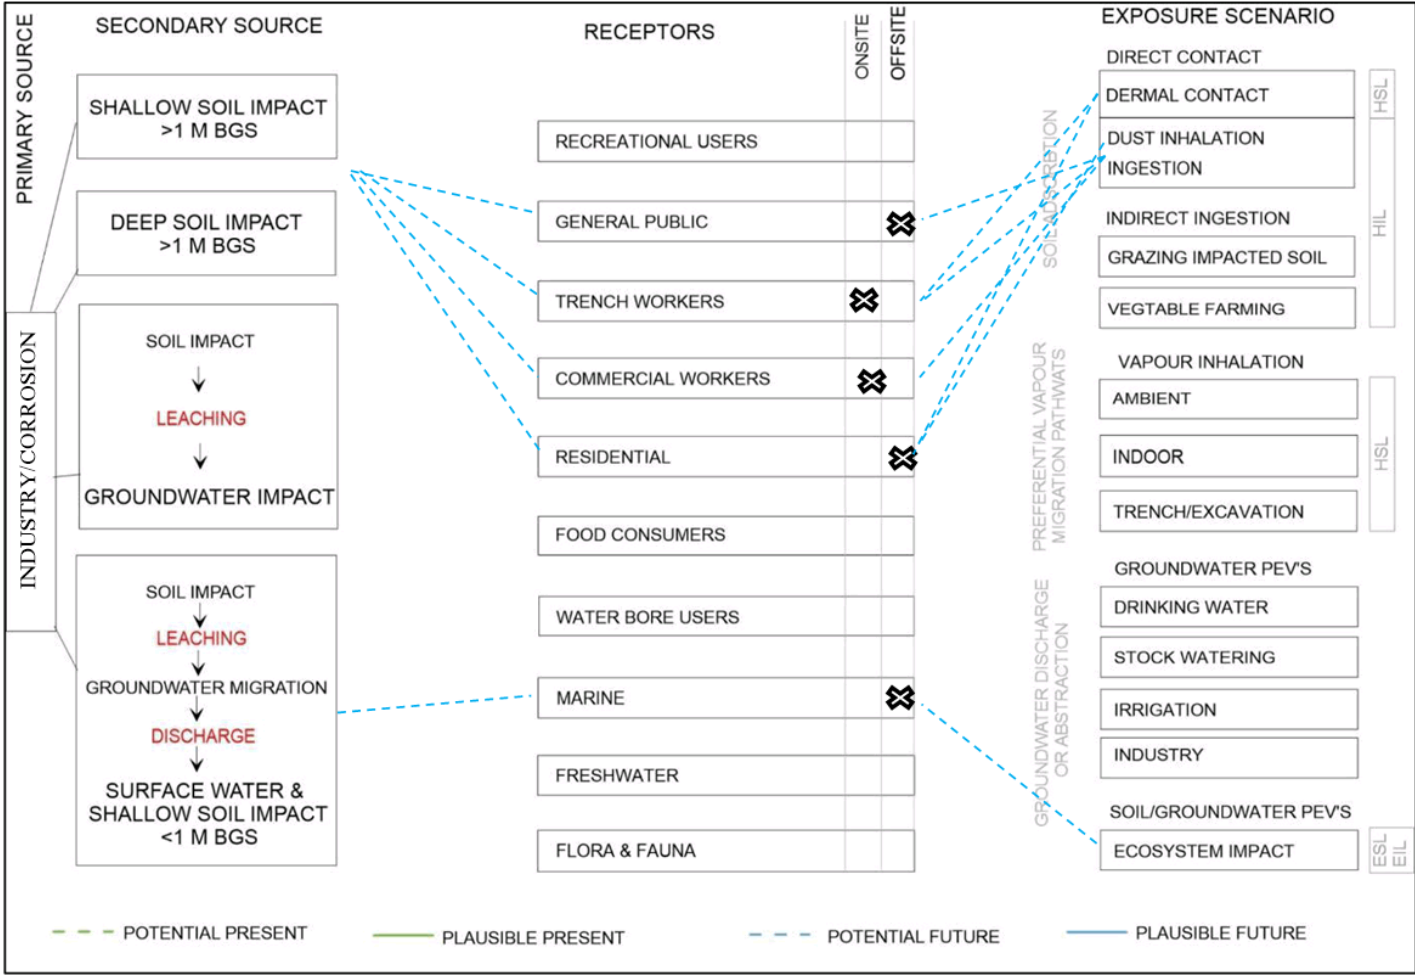

Figure 13 Conceptual Site Model Identifying Contamination Source, Receptors and Transport Mechanisms/Exposure Route

Geo Environmental Solutions – GES

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

### 13 CONCLUSIONS

The following can be concluded from the site assessment:

- Uncontrolled fill was encountered across most of the site to depths of greater than 3.3 m bgs with the deepest fill apparent in the center of the site along a former Hobart Town Rivulet alignment. Fill comprised of mixed alluvial type clay, silt, sand and gravel sediments with occasional bricks. Natural underlying sediments comprised of clay, silt and sand;
- One UST was confirmed present on site and two suspected abandoned UST's could not be located during the investigation. The second phase of investigation did not provide any evidence of hydrocarbon impact which could be used to trace the location of any of the UST's;
- As there are no decommissioning records for the UST's on site there are possibly two or more unidentified UST's still present on the site which will require adequate handling and disposal in accordance with EPA regulations;
- BTEX compounds were present in low concentrations in an isolated onsite bore indicating there may have been historical product release. There is a chance that soil and groundwater surrounding the UST's may have minor hydrocarbon impact which will need to be managed and disposed of;
- Groundwater flow directions were discerned to be directed towards the center of the site at a very shallow gradient towards the original Hobart Town Rivulet stream channel to the southeast and the revised Hobart Rivulet. Groundwater migrating from the site is likely to follow the path of least resistance and travel in an southeasterly direction towards Victoria Dock. Groundwater fate calculations have determined that there is a low risk that significant volumes of groundwater (several milliliters per second) will enter the revised rivulet alignment;
- Volatile hydrocarbon contaminants such as BTEX, naphthalene and C<sub>6</sub> to C<sub>16</sub> have not been identified in high concentrations (sufficient to impact groundwater). Vapour intrusion risk is identified as low given the proposed land used;
- The excavation of soil for installation of footings and service trenches is likely to unearth PAH and potentially lead affected soils on the site, which will need to be handled through application of a contamination management plan which should include dust suppression strategies. Soil will require classification according to EPA IB 105;
- Given that the proposed future ground floor is expected to be entirely paved and sealed, there is expected to be limited opportunity for exposure to future site commercial workers;
- An indoor vapour intrusion risk is not apparent at the site based on the proposed development involving a ground floor commercial space.
- The most significant management issue at the site is therefore the presence of hydrocarbon (PAH) and heavy metal contamination in shallow fill underlying the surface of site. Removal of existing site surfaces may result in mobilization of hydrocarbons and metals towards neighboring properties and stormwater systems during storm events. As detailed in a CMP, stormwater will need to be collected, stored and collected prior to offsite disposal. A soil and water management plan will need to be put in place to manage site erosion risks. Similarly, during dry conditions, impacted soil may become an airborne creating a dust inhalation hazard which will need to be managed in a CMP.
- The concentration of all IB105 compounds analysed at the site average out to level 1 except for:
  - TRH C10-C36 which is level 2;
  - Total PAH is level 3; and
  - Benzo(a)pyrene is level 3.
- The Sullivan's Cove Planning Scheme 1997, Schedule 8 states that: *the applicant is to provide information to demonstrate that an appropriate level of cleanup of the site is to occur. Alternatively, the applicant is to demonstrate that the proposed activity will not result in an immediate or likely long term hazard to human health or the environment.* GES can confirm once the development is complete and the site is 100% sealed, there will be;
  - No opportunity for exposure to soil contamination by commercial workers or guest to the property, thus mitigating the human health risk; and

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

- No opportunity for the infiltration of rainwater to mobilise metals or PAH's into the groundwater and/ or the marine environment.
- Minimal risk posed by site contamination to the environment

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

## 14 RECOMENDATIONS

The primary concerns at the site which need to be managed include:

- There is a low risk that soils may leach and enter the marine environment,
- A moderate to high risk that impacted surface waters and soil may flush offsite into neighboring properties and into the waterways during storm events;
- Management of onsite workers to limit health risks from:
  - Potential dermal contact with hydrocarbon impacted soil;
  - Ingestion of soil or inhalation of dust contaminated with lead or PAH compounds.
  - Management of dust to prevent transport towards surrounding residences and public; and
  - The potential that shallow impacted soil may be unearthed by future trench workers.

The following management approaches are recommended:

- Producing a Contamination Management Plan (CMP) to minimize the above health and environmental risks; and
- Anecdotally, cyanide gasses have been identified in gasworks waste in the area. Precautions need to be put in place to ensure the risks are appropriately managed through soil, groundwater and gas monitoring;
- The underground fuel storage tanks identified in the workplace standard records will require decommissioning according to EPA regulations as part of site redevelopment works.

A CMP is required for the demolition, excavation and construction phases of the proposed development. The following considerations should be included in the CMP:

- During excavation, there needs to be close consideration to minimise the amount of time that any excavated soil is exposed;
- Given the above may be difficult to limit, the following are recommended:
  - Installing a perimeter drain around the site and diverting all surface water to a sump before being pumped into temporary storage vessels for regulate disposal to an approved offsite facility. Timely testing (allowing for a 5-day delay) will be required to test the water to discern the best disposal option for the water;
  - Runoff risk will remain in place until a final concrete surface covering is put in place over the site. This includes the period when the site has been infilled to the proposed bottom of slab level when water will continue to percolate and discharge offsite. Subsurface perimeter drains should remain active, and the sump should remain up to the final stage of slab preparations works.
  - A soil and water management plan will need to be put in place which detail measures to be put in place to manage offsite migration of hydrocarbon and heavy metal impacted soil;
  - Ensuring that dust barriers are put in place to limit offsite migration of excavated soils;
  - Standard procedures to minimize dust creation;
  - General PPE controls;
- Crushed bedrock should be kept separate to the fill material to minimise disposal cost of contaminated material; and
- Given the historical industrial nature of the site, all excavated soil at the site is to be stockpiled systematically, tested for contamination and results are to be compared against IB105 guidelines and managed appropriately. The upper meter of the site is shown to be consistently impacted, and consideration should be given to storing shallow soil separately to minimize offsite disposal costs.

*Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018*

If the CMP is adhered to, GES concludes that there is a low risk that soil with elevated concentrations of contaminants will become exposed to sensitive receptors. Key points to be identified within the CMP include:

- Standard building site security fencing should be constructed to ensure that sensitive receptors do not have access to the exposed soil during construction;
- It is recommended that stockpiled fill material is covered as soon as practicable to ensure that the material is not left to dry out and become airborne because of wind or general earthworks disturbance;
- A physical separation layer is recommended in areas where there is ground disturbance. The CMP should be referred to for specifics on defining disturbed areas and measures to be put in place to remediate disturbed ground. This may include areas outside of the identified investigation areas.
- Unless areas are known to have been topped with clean fill, as a general recommendation, areas that are prone to drying out should either be moderately irrigated to prevent dust being generated or investigated with further soil testing to assess the need for further physical separation barriers.
- A soil and water management will need to be put in place which should initiate as soon as surface removal occurs until the site is finally paved with the ground level slab. An assumption needs to be made that all water and soil residing on the surface of the site is impacted and needs to be appropriately managed. The soil and water management plan needs to detail likely pathways where surface water will migrate and where erosion is likely. All surface water migrating to the perimeter of the site will need to be collected and disposed offsite at an approved facility.
- The proposed site works present a very low human health risk to future users of the site; and GES advise that during the site redevelopment, there is a low risk that site contamination will present an environmental risk.
- Following development of the site the existing soil contamination also poses a low risk of harm to human or environmental receptors as the construction and sealed nature of the site prevents any pathway-receptor links.

## **LIMITATIONS STATEMENT**

This monitoring Report has been prepared in accordance with the scope of services between Geo-Environmental Solutions Pty. Ltd. (GES) and Fragrance TAS – HOBART (Collins) Pty Ltd ('the Client'). To the best of GES's knowledge, the information presented herein represents the Client's requirements at the time of printing of the Report. However, the passage of time, manifestation of latent conditions or impacts of future events may result in findings differing from that described in this Report. In preparing this Report, GES has relied upon data, surveys, analyses, designs, plans and other information provided by the Client and other individuals and organisations referenced herein. Except as otherwise stated in this Report, GES has not verified the accuracy or completeness of such data, surveys, analyses, designs, plans and other information.

The scope of this study does not allow for the review of every possible soil and groundwater contaminant over the whole area of the site. Samples collected from the investigation area are assumed to be representative of the areas from where they were collected and indicative of the contamination status of the site at that point in time. The conclusions described within this report are based on these samples, the results of their analysis and an assessment of their contamination status.

This report does not purport to provide legal advice. Readers of the report should engage professional legal practitioners for this purpose as required.

No responsibility is accepted for use of any part of this report in any other context or for any other purpose by third party.

## **Appendix 1 GES Staff and Qualifications**

Geo-Environmental Solutions (GES) is a specialist geotechnical and environmental consultancy providing advice on all aspects of soils, geology, hydrology, and soil and groundwater contamination across a diverse range of industries.

Geo Environmental Solutions Pty Ltd:

- ACN – 115 004 834
- ABN – 24 115 004 834

### **GES STAFF - ENGAGED IN SITE INVESTIGATION WORKS**

*Dr John Paul Cumming B.Agr.Sc (Hons) Phd CPSS GAICD*

- Principle Author and Principle Environmental Consultant
- PhD in Environmental Soil Chemistry from the University of Tasmania in 2007
- 12 years' experience in environmental contamination assessment and site remediation.

*Ms Sarah Joyce BSc (Hons)*

- Senior Environmental Scientist
- Honours in Geography and Environmental Science at the University of Tasmania in 2003;
- Undergraduate Degree Double Major in Geology and Geography & Environmental Science
- 15 years professional work experience and six years contaminated site assessment

*Mr Kris Taylor Bsc (Hons)*

- Senior Environmental & Engineering Geologist
- Honours in Environmental Geology at the University of Tasmania in 1998
- 15 years' experience in environmental contamination assessments and hydrogeology (including honours in mine site tailing pollution assessment)

*Mr Grant McDonald (Adv. cert. hort.)*

- Soil Technician
- 6 years' experience in hydrocarbon and heavy metal contamination sampling of soils and groundwater.

*Mr Aaron Plummer (Cert. IV)*

- Soil Technician
- 3 years' experience in hydrocarbon and heavy metal contamination sampling of soils and groundwater.

Environmental Site Assessment – Version 8 – 2 Collins Street, 26 July 2018

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

### General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot.  
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
LOR = Limit of reporting  
RPD = Relative Percentage Difference  
# = Indicates failed QC

### Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

### Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: SOIL

#### Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory spill sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

#### Summary of Outliers

##### Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NQ** Method Blank value outliers occur.
- **NQ** Laboratory Control outliers occur.
- Duplicate outliers exist - please see following pages for full details.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NQ** surrogate recovery outliers occur.

##### Outliers : Analysis Holding Time Compliance

- **NQ** Analysis Holding Time Outliers exist.

##### Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

#### Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for **VOC in soils** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive as Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: \* = Holding time breach ; ✓ = Within holding time.

| Method                          | Sample Date | Extraction / Preparation |                    |            | Analyte       |                  |            |
|---------------------------------|-------------|--------------------------|--------------------|------------|---------------|------------------|------------|
|                                 |             | Date extracted           | Due for extraction | Evaluation | Date analysed | Due for analysis | Evaluation |
| Container / Client Sample ID(s) |             |                          |                    |            |               |                  |            |

### Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

| Quality Control Sample Type      |            |    | Count   |        | Rate (%) |            | Quality Control Specification  |
|----------------------------------|------------|----|---------|--------|----------|------------|--------------------------------|
| Analytical Methods               | Method     | QC | Regular | Actual | Expected | Evaluation |                                |
| Laboratory Duplicates (DUP)      |            |    |         |        |          |            |                                |

### Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

| Analytical Methods                   | Method     | Matrix | Method Descriptions  |
|--------------------------------------|------------|--------|--|
| Moisture Content                     | EA005      | SOIL   | In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).   |
| Total Metals by ICP-AES              | EG006T     | SOIL   | In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)   |
| Total Mercury by FIMS                | EG035T     | SOIL   | In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl <sub>2</sub> ) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl <sub>2</sub> which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)   |
| TRH - Semivolatile Fraction          | EP071      | SOIL   | In house: Referenced to USEPA SW 846 - 8015A. Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.   |
| PAH/Phenols (SIM)                    | EP075(SIM) | SOIL   | In house: Referenced to USEPA SW 846 - 8270D. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)  |
| TRH Volatiles/BTEX                   | EP080      | SOIL   | In house: Referenced to USEPA SW 846 - 8260B. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.  |
| Dissolved Metals by ICP-MS - Suite A | EG020A-F   | WATER  | In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.  |
| Dissolved Mercury by FIMS            | EG035F     | WATER  | In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl <sub>2</sub> ) (Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl <sub>2</sub> which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3) |
| TRH - Semivolatile Fraction          | EP071      | WATER  | In house: Referenced to USEPA SW 846 - 8015A. The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)  |
| PAH/Phenols (GC/MS - SIM)            | EP075(SIM) | WATER  | In house: Referenced to USEPA SW 846 - 8270D. Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)  |

*Environmental Site Assessment – Version 8 – 2 Collins Street. 26 July 2018*

Page : 10 of 10

 Project : 2 Collins Street

| Analytical Methods  | Method  | Matrix | Method Descriptions   |
|---|---------|--------|---|
| TRH Volatiles/BTEX  | EP080   | WATER  | In house: Referenced to USEPA SW 846 - 8260B. Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GC/MS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3).       |
| Preparation Methods   | Method  | Matrix | Method Descriptions   |
| Hot Block Digest for metals in soils, sediments and sludges | EN69    | SOIL   | In house: Referenced to USEPA 200.2. Hot Block Acid Digestion. 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202). |
| Methanolic Extraction of Soils for Purge and Trap           | ORG16   | SOIL   | In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.   |
| Tumbler Extraction of Solids                                | ORG17   | SOIL   | In house: Mechanical agitation (tumbler). 10g of sample, Na2S2O4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.   |
| Separatory Funnel Extraction of Liquids                     | ORG14   | WATER  | In house: Referenced to USEPA SW 846 - 3510B. 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3). ALS default excludes sediment which may be resident in the container.                              |
| Volatiles Water Preparation                                 | ORG16-W | WATER  | A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.   |

### General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key :  
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot  
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.  
 LOR = Limit of reporting  
 RPD = Relative Percentage Difference  
 # = Indicates failed QC

### Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

### Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

#### Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

### Summary of Outliers

#### Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NQ** Method Blank value outliers occur.
- **NQ** Duplicate outliers occur.
- **NQ** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.

#### Outliers : Analysis Holding Time Compliance

- **NQ** Analysis Holding Time Outliers exist.

#### Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

 Project : Collins

#### Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

| Compound Group Name                            | Laboratory Sample ID | Client Sample ID | Analyte | CAS Number | Data           | Limits | Comment   |
|--|----------------------|------------------|---------|------------|----------------|--------|---|
| <b>Matrix Spike (MS) Recoveries</b>            |                      |                  |         |            |                |        |   |
| EP075(SIM)B: Polynuclear Aromatic Hydrocarbons | EM1602834-005        | TH01 4.2-4.5m    | Pyrene  | 129-00-0   | Not Determined | ----   | MS recovery not determined, background level greater than or equal to 4x spike level. |

#### Regular Sample Surrogates

Sub-Matrix: **SOIL**

| Compound Group Name                       | Laboratory Sample ID | Client Sample ID | Analyte              | CAS Number | Data   | Limits   | Comment  |
|---|----------------------|------------------|----------------------|------------|--------|----------|--|
| <b>Samples Submitted</b>                  |                      |                  |                      |            |        |          |  |
| EP075(SIM)S: Phenolic Compound Surrogates | EM1602834-044        | BH11 0.4-0.5m    | 2-Chlorophenol-D4    | 93951-73-6 | 27.7 % | 65-123 % | Recovery less than lower data quality objective    |
| EP075(SIM)S: Phenolic Compound Surrogates | EM1602834-044        | BH11 0.4-0.5m    | 2,4,6-Tribromophenol | 118-79-6   | 10.8 % | 34-122 % | Recovery less than lower data quality objective    |
| EP075(SIM)T: PAH Surrogates               | EM1602834-069        | BH10 3.4-3.5m    | 2-Fluorobiphenyl     | 321-60-8   | 128 %  | 61-125 % | Recovery greater than upper data quality objective |

#### Outliers : Frequency of Quality Control Samples

Matrix: **SOIL**

| Quality Control Sample Type        | Count |         | Rate (%) |          | Quality Control Specification  |
|------------------------------------|-------|---------|----------|----------|--------------------------------|
| Method                             | QC    | Regular | Actual   | Expected |                                |
| <b>Laboratory Duplicates (DUP)</b> |       |         |          |          |                                |
| TRH - Semivolatile Fraction        | 7     | 72      | 9.72     | 10.00    | NEPM 2013 B3 & ALS QC Standard |

Matrix: **WATER**

| Quality Control Sample Type        | Count |         | Rate (%) |          | Quality Control Specification  |
|------------------------------------|-------|---------|----------|----------|--------------------------------|
| Method                             | QC    | Regular | Actual   | Expected |                                |
| <b>Laboratory Duplicates (DUP)</b> |       |         |          |          |                                |
| PAH/Phenols (GC/MS - SIM)          | 1     | 13      | 7.69     | 10.00    | NEPM 2013 B3 & ALS QC Standard |
| <b>Matrix Spikes (MS)</b>          |       |         |          |          |                                |
| TRH - Semivolatile Fraction        | 0     | 19      | 0.00     | 5.00     | NEPM 2013 B3 & ALS QC Standard |

#### Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: ✖ = Holding time breach ; ✔ = Within holding time.

### Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: ✖ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

| Quality Control Sample Type      |            | Count |         | Rate (%) |          | Evaluation | Quality Control Specification  |
|----------------------------------|------------|-------|---------|----------|----------|------------|--------------------------------|

### Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

| Analytical Methods                   | Method     | Matrix | Method Descriptions   |
|--------------------------------------|------------|--------|---|
| Moisture Content                     | EA055-103  | SOIL   | In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).  |
| Total Metals by ICP-AES              | EG005T     | SOIL   | In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)  |
| Total Mercury by FIMS                | EG035T     | SOIL   | In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl <sub>2</sub> )(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl <sub>2</sub> which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)   |
| Pesticides by GCMS                   | EP068      | SOIL   | In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM (2013) Schedule B(3) (Method 504,505)   |
| TRH - Semivolatile Fraction          | EP071      | SOIL   | In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40.   |
| PAH/Phenols (SIM)                    | EP075(SIM) | SOIL   | In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)  |
| TRH Volatiles/BTEX                   | EP080      | SOIL   | In house: Referenced to USEPA SW 846 - 8260B Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.  |
| Dissolved Metals by ICP-MS - Suite A | EG020A-F   | WATER  | In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.   |
| Dissolved Mercury by FIMS            | EG035F     | WATER  | In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl <sub>2</sub> )(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl <sub>2</sub> which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3) |
| TRH - Semivolatile Fraction          | EP071      | WATER  | In house: Referenced to USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)  |
| PAH/Phenols (GC/MS - SIM)            | EP075(SIM) | WATER  | In house: Referenced to USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)  |

| Analytical Methods   | Method  | Matrix | Method Descriptions   |
|--|---------|--------|---|
| TRH Volatiles/BTEX   | EP080   | WATER  | In house: Referenced to USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)        |
| Preparation Methods  | Method  | Matrix | Method Descriptions   |
| Hot Block Digest for metals in soils sediments and sludges | EN69    | SOIL   | In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202) |
| Methanolic Extraction of Soils for Purge and Trap          | ORG16   | SOIL   | In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.   |
| Tumbler Extraction of Solids                               | ORG17   | SOIL   | In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.  |
| Separatory Funnel Extraction of Liquids                    | ORG14   | WATER  | In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.                            |
| Volatiles Water Preparation                                | ORG16-W | WATER  | A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.   |

## Engineer's Report

Service and calibration. Found SUnit is moisture sensitive due to corroded PID sensor. Replace sensor. Replace metal filter. Clean pump and adjust stall settings. Check PC communications, configuration settings and data download. Test sensor response OK- unit is not moisture sensitive. Fit new inlet filter. Calibrate.

## Engineer's Report

Data download and PC configuration checked O.K.  
 PID sensor checked if moisture sensitive - passed O.K.  
 Instrument pump assembly, lamp and rubber boot cleaned.  
 Pump flow rate >400mL/min.  
 Unit calibrated and serviceable.

#### Engineer's Report

Service and calibration. Fit new inlet probe- broken. Clean pump and adjust stall settings. Check PC communications, configuration settings and data download. Test sensor response-OK. PID sensor is not moisture sensitive. Fit new inlet filter. Calibrate.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

### General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

\* = This result is computed from individual analyte detections at or above the level of reporting

a = ALS is not NATA accredited for these tests

- = Indicates an estimated value.

- EP080: Particular samples (EM-1710504-023.035) show minor BTEX hits. Confirmed by re-analysis.
- EG035T: EM1710404-001 Poor duplicate precision for total mercury due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- EG035T: EM1710404-001 Poor matrix spike recovery for total mercury due to sample matrix. Confirmed by re-extraction and re-analysis.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1,2,3-cd)pyrene (0.1), Dibenzo(a,h)anthracene (1.0), Benzo(g,h,i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1,2,3-cd)pyrene (0.1), Dibenzo(a,h)anthracene (1.0), Benzo(g,h,i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.

### **General Comments**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

ø = ALS is not NATA accredited for these tests.

- EP080: Particular sample (EM-1602834-042) shows minor BTEX results. Confirmed by Qc sample.
- EP080: Particular sample (EM-1602834-068) shows minor BTEXN results. Confirmed by re-analysis.
- EP075(SIM): Surrogate recoveries for sample EM1602834-044 fall outside of published limits as a result of suspected matrix interferences. Surrogate recoveries have been confirmed by re-extraction.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1,2,3-cd)pyrene (0.1), Dibenzo(a,h)anthracene (1.0), Benzo(g,h,i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1,2,3-cd)pyrene (0.1), Dibenzo(a,h)anthracene (1.0), Benzo(g,h,i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
